Does anyone have any comments regarding DRSI's plug-in TNCs for IBM
compatibles? Particularly the PCPA Type 1, which (if I understand
the literature correctly) is a 1200 baud VHF TNC with a serial port
for an external modem.

How do the DRSI TNCs compare with AEA's PK-88 (and its plug-in equivalent,
PCB-88)?

Any comments would be appreciated...Joakim

Simple enough: is there WA8DED-type HOST-mode available for PK-88?

If so, could someone kindly tell me where?

  I'm in the process of using DS SS to help qualify potential paths for the 256 kbps 900 and 1200 MHz radios I am building as part of a prototype higher speed amateur network here in northern California. I'm also considering inexpensive methods to use SS to combat multipath distortion.

I will be in Hong Kong a lot over the next few years on business. I would like to find out if they have 2m or 440 packet operations over there. Is there anyone that knows if it is possible to do this? I know about the reciprocal license required. I would like to send a packet message to Hong Kong from here but I'm not sure of the address. I want to do something like: SB help @ xxxxx.HKG.AS   What would go after the @ in order to send a general bullitin asking for more info?
Thanks in advance.

I found that having a lower deviation seemed to help when working
low-Earth-orbit satellites like MIR and the Space Shuttle. My HT
can't QSY 3 Khz, so keeping the deviation low was the easiest way
to insure that I didn't pop out of the satellite's receive passband.
(Doppler shift causes the TX/RX to be translated up to 3.3 kHz on 2 meters!)

3.5 kHz deviation was pretty reliable for me.

About a year ago I inherited a PK-88 that had problems with the battery

backup circuit. I finally got around to troubleshooting it today.
Apparently there was an error at the factory during installation of
the original backup battery. It was shorted out! The mistake was an easy
one to make, since the correct teminal was about 1/16 inch away, and
not labeled clearly.

Has anyone else found similar factory wiring errors? While it is possible
that the original owner caused the problem, I consider it unlikely.
He said he hadn't ever changed the battery, and just assumed that the
battery was old. Also, the solder looked like the rest of the board, not
shiny like a hand-soldered joint.

Now my IP node will be able to recover from power outages completely
automatically, so it was worth the trouble to track down.

Happy New Year!
   John KJ9U

New England Packet Radio Association Meeting
(NEPRA)

Saturday January 11, 1991 at 1 PM
(Note the change of day and time)

There will be a beginner's session from 1 to 1:30 PM. A short business meeting, then a talk on how to use the Packet Node Network of New England.

The meeting will be held at the MITRE Corporation in Bedford, Ma. Easy access at the junction of Routes 3 and 62.

Directions
From Route 128, take Route 3 North one exit to Route 62. At the end of the down ramp (at the traffic light) turn right (East) on 62. (See below)

From Route 495 near Lowell, take Route 3 South to Route 62. At the end of the down ramp turn left (East), passing under Route 3 on Route 62.

MITRE is the large complex immediately on your left at the second set of traffic lights. Enter the MITRE driveway and bear left at the fork. Either;

1) Drive around the two story garage, pass over two speed bumps and turn right into "PC" parking lot. The cafeteria is the only one story building off this parking lot. Or,

2) Park in the two story garage at the top of the small hill after entering the MITRE driveway. Use the asphalt walkway around the south side of the building under construction heading east between the two two story buildings marked "B" and "D" to the next one story building marked "C".

In either case, enter the cafeteria (one story building) down a narrow hardtop walkway on the West side of the building.

Future Meetings
April 1991 Sysop Discussion (tentative)
July 1991 User Meeting (tentative)

```

The calibration notes for TAPRs version 1.1.7b TNC-2 EPROM recommends a frequency shift of 800 Hz as opposed to 1000 Hz on older TNCs. The only reason given is 'improved performance'. The notes say the shift is compatible with older TNCs running the 1000 Hz shift and so far I seem to have no trouble talking to TNCs that I talked to before with the 1000 Hz shift.

Question: What are the details behind this 'improved performance' by using the 800 Hz shift?

Probably a FAQ, but

     Where can I find data and the boards/modems?

Yeah, my buddy Dave (KD5RO) put one together, with me standing over him
watching...then I helped him figure out a few things with the software.
This is Dave's first experience with packet. The software is slick!

Only weird thing I noticed is that the docs say, in several places, that
the modem is an AM7911...but they give you a standard AM7910. I couldn't
get data on an AM7911, and I'm guessing that this is a misprint. (I was
hoping it would be a 7911 with a DECENT carrier detect circuit!).

     I am not familiar with this kit but I assume that it is using the
     TCM 3105 modem IC and it is "stealing" its power from PC RS-232
     port.

>I'm mating the modem to a Zenith SuperSport laptop and
>a Yaesu FT-470.
     I have Zenith MiniSport and I had just the same problem. It appeared
     that the Motorola CMOS RS232 driver in Zenith could not drive enough
     current to the modem when transmitting. +5V pin in the modem chip went
     to abt +3V and it would not key the TX. Obvious solution is to get
     external power supply for the chip (I got it from the modem slot). Now
     it works fine.

You have two options to achcive this. First one is Get the 3.06 firmware upgrade from kantronics. The new version of the firmware allows you to do Software DCD instead of the normal sqeulch CD. Second option is to get the DCD kit with internal clock from TAPR. It basically does the same thing except you can't turn it off in the software, and its an extra lump in the case. I have the 3.06 Firmware in my KPC-2, and a TAPR DCD in my PK-88, and I am completely satisfied with both systems. It seems that the TAPR DCD might be able figure out packets that the KPC-2 cannot, but that might be a limitation of the TNC.

An Australian distributor has recently made this short-form kit available (PCB and EPROM), but the documentation is a little on the sparse side... Basically, there is a (hand-corrected) bill of materials, and a (hand-corrected) barely-readable circuit diagram.

Apparently the device is capable of wondrous things, if only I had further information! What really piqued my interest was the on-board "data transciever" (sic), and the circuit shows it as a little block, with audio & PTT etc, and a little BNC connector on the side... It looks for all the world like the unit is part of some data engine or other.

The ultra-fine print refers to the whole thing as a Pac-Comm EM-NB96 External FSK Modem, with other references on the PCB as "DFM-SA". The Bill of Materials is just a copy of a FAX from "NX2P Electronics" to Pac-Comm.

Anyone have any further info on this beast? NX2P, are you reading this?
A lot of people have ordered this kit, and some more info would be nice.

  Would like to get a laptop that supports baycomm's hardware board.
The board i have is: tcm 3105 modem for baycom by n4plk.
Some laptops will power this board via the serial port.
If you have done that what kind of laptop do you have. Need the model etc
since i am thinking of getting one. Also associated with that laptop is:
i have 12v in the computer shack and would like to power the laptop directly.
So if you would be so kind as to reply. I will summarize to the net if there
is enough interest.
 Requirements:
1. serial port to power the n4plk board
2. laptop runs on 12v direct

Can someone suggest a set of NOS parameters to start with for use in a
congested packet area (NE NJ). I have started with the parameters that
came with my version of NOS (2.7 for the Amiga) and my throughput
compared to my TNC's AX.25 packet is horrible. I have attempted to
transfer as many of the parameters as possible which are directly
translatable but I still have terrible throuhput. My params in my TNC
have been optimized for my area and radio and would like a good starting
point to use for a congested area running NOS and TCP/IP.

I'm a relatively new packet user and a Macintosh diehard. So I've been looking for Macintosh packet software, of course. The only problem is I haven't been able to find any! There was a message in this newsgroup about a month ago suggesting that Mac users look in the ucsd.edu archive, but I couldn't find anything there for the Mac.

So here's the question: is there any Macintosh software for packet radio out there? I would be interested in public domain, shareware, or commercial programs. Are there Internet archives with Mac-specific software? What are good commercial sources?

I'm using a PacComm HandiPacket with a Kenwood HT. For the time being, I'm just using a generic terminal program on the Mac. (I also have an Atari Portfolio for portable packet operation.)

Any help you can offer will be much appreciated!

>hoping it would be a 7911 with a DECENT carrier detect circuit!).

According to the doc, the 7910 is for 'switched network applications' and
the 7911 is for 'leased-line, telex and voideo applications'. Basically it's
the same part, but there are some differences (7911 vs 7910):
- Reduced CD response time
- Reduced RTS to CTS response time
- Reduced squelch time for 1200bps modems
- Two new modes for bell 202 with 150bps backchannel
- three new modes for V23 with soft turn-off tone
- the V23 modes include 150bps backchannel
- The AM7911 supports CCITT R.20 for telex applications.

The CD detection times are:

	7910	7911	
tCD(on)	18-22	3-7	ms
tCD(off)	12-23	3-11	ms

I can copy some doc if you are interested.

A side remark: I would suggest you build a fast noise squelch, as in
the HAPN 4800 baud modem. You could build the rest as well (all the parts
together are cheaper as one 7910!), and have a MUCH FASTER network.
7910 and 7911 (and TCM3105, for that matters) were never designed for
an CSMA network. They hold off CD even if they already recognized another
carrier, allowing your station to jump on that station and make another
collision!

You could build a sequencer (the TAPR board, for instance) but that gives
other problems: in our environment, HAPN 4800 baud modems share frequency
with antique bell 202 1200 baud modems. The sequencer squelch, however, does
not recognize 4800 baud signals and allows collisions over them.
Same goes for the Baycom thing..
Will this mean we will always stay at 1200 baud? I shure hope we don't,
if you ever worked at higher speeds you know why!

ucsd.edu has a few versions of NET/Mac, the Macintosh port of Phil Karn's
TCP/AX.25/NETROM packet software. (There is no Macintosh package based on
his later NOS software.) They're in the hamradio/packet/ka9q/net directory.

I use NET/Mac for all my packet activities, from transferring files on the TCP/IP channel to reading DX callouts on the PacketCluster. The more recent versions of NET/Mac have a separate window for each different session; even the earlier ones have separate console, trace, and log windows, which is very helpful.

Patty

p.s. Although it won't do you any good, I understand that AEA offers multimode Macintosh software (packet, RTTY, etc.) for their PK-232 TNCs.

The MacNet seems to be a disks-by-mail service providing a wide range
of shareware and freeware software. It would certainly seem to be a pretty
good potential source to look into.

If you need it for a PC, then you may be able to use BPQ to provide a DED
host mode. It involves running the TNC in KISS mode, configuring the BPQ
switch (reasonably straight forward), and using the dedhost.com
driver. The application interface to dedhost.com is a combios like.

  The latest release of BPQ that I am aware of is 4.04 July 1991. Does
anyone know/have a later version?

Actually, I've been working on changing that with TAPR. In the next Packet
Register that address of

   tapr@wb7tpy.ampr.org

Will be ok for addressing them on the internet. At the moment, this is read
only for them, and from our discussions, if the need exists, we'll start up a
two email link.

 [...]
I apologize for the attempt to respond to this a few days ago that only
succeeded in echoing the original message, I goofed...

I use the N4PLK Baycom modem successfully with a KayPro 2000 laptop.
The serial port did not provide enough juice to power the modem,
however. The KayPro uses a 6 volt battery charged by a nominal 7.3 volt
power supply; the RS-232 signals at the serial port do not go positive
enough to feed the 78L05 regulator on the modem board.

Another solution was available with one of my 2 meter rigs, a KDK 2016
-- the auxiliary jack at the back provides access to 12 volts d.c. as
well as to the audio and mic and ptt lines. See if that is an option with

your 2 meter rig.
Another option -- use a 9 volt battery. The N4PLK modem will work fine
with a 9 volt supply.

Baycom vs PMP:

Software: Baycom's packet assembler/disassembler is a Terminate and Stay
Resident (TSR) program. You can shell out to DOS and leave the TSR

active while you do something else. It uses a lot of memory, though, so you can't run a big program. PMP is a single program.

Interface: Baycom is much more sophisticated, almost a full-service packet system. PMP is much simpler. Parameters can be changed at any time in Baycom, with PMP you have to stop the program and change the config file, then start up again. Baycom has a lot more commands than PMP.

Documentation: PMP comes with source code; Baycom is a big secret. PMP's documentation is clear, Baycom's from the German translated is. (Although version 1.4 docs are much better than vers. 1.2). PMP's authors are reachable on the Internet. It took six months after I mailed my registration to Germany to get a disk back with the new version of Baycom, and there was no response to the questions I had asked in my letter.

Hardware: The modems are not quite functionally identical. I have a TCM3105 modem from the PMP authors and a Baycom TCM3105 version from N4PLK. The PMP modem supplies a carrier detect signal to the computer, Baycom's software apparently just senses data coming in. The Baycom modem has to connect to serial port RS232 lines with higher, bipolar voltages; the N4PLK modem isolates the modem chip with 74HC04 buffers so the program must be dealing with inverted signals relative to the PMP program. The PMP modem connects to TTL level signals at a parallel port. It would be a service if someone would design a modem compatible with both systems; it could be done with a few extra parts and some jumpers. One version of the PMP modem has a watchdog circuit that prevents accidentally keying the transceiver when the program is not active. This accidental keying was a problem for me with Baycom, I had to remember to disconnect the modem from the computer or turn off the transceiver when using the computer for other purposes.

Power requirements: both modems can get power from a serial port. (Note this would tie up both serial and parallel ports with PMP). This did not work on my own laptop, which has relatively low RS232 voltages. In my case I was able to get 12 volts from the 2 meter transceiver. A 9 volt battery will work also. Either modem can be built compactly enough to fit into a DB25 shell.

On the horizon: The German authors of Baycom refer in the documentation to a hardware package that will go with the software and support many more features, including multiple baud rates. I have seen no information on availability of this hardware in the US, and I don't know if it is beyond the prototype stage in Europe. The software version has commands to support 300 baud, but I don't know if it will actually work. The TCM 3105 modem chip can not be made to work at 300 baud in the proper data format. The PMP authors did not try to include any 300 baud support; they say it would require a 7910 type modem and they thought the higher power consumption was not compatible with their other system requirements.

The Germans indicate they are doing further development, we'll have to wait and see what happens. Since the workings of the software are a secret, nobody else can do much along these lines. Since source

code is provided for PMP I would expect improvements could come from all over the place once people start attacking the problems.

Conclusions: Either system is an effective way to get going. Baycom is more elegant and complete. Both systems may not work with all computers, as they depend on using serial and parallel ports in non-standard ways. N4PLK offered to refund the cost of his modem (when purchased assembled and tested) if it was found to be incompatible. I don't know if that offer still stands, it was made last spring when he first started marketing the device. In some cases the incompatibility may be simply the inadequacy of the serial port as a source of power.

PMP is a better way to go if you are enough of a C programmer that you could think of implementing your own improvements. Baycom has more features but is a black box inside.

I have used Baycom on and off for more than 6 months, and I am beginning to see messages on packet BBSs indicating there is a community of users out there. I have only experimented a little with PMP, enough to know it also works. PMP got a later start, but I have seen some messages about it, too. I would expect some kind of users groups to form, but I haven't heard of any yet. Maybe someone will respond to this message with some info on that.

Keywords: New Jersey Scanner Law
Lines: 18

The New Jersey State Senate approved the new scanner bill S-305 today.
The New Jersey State Assembly had previously passed this bill last
Wednesday. The Governor is expected to view the bill favorably and
will probably sign it into law in the next week. I don't have the
information on the effective date, but it will be soon.

This law replaces the existing statute which makes it a crime to
carry any scanner or radio capable of receiving police, fire et al
communications in a vehicle. This makes it difficult for Radio Amateurs
to have modern radios in their cars due to the extended coverage
that they provide.

The new law makes it a crime to possess a scanner while committing, or
attempting to commit, another crime anywhere in the state. Law-abiding
citizens will be free to enjoy free access to communications while
the criminals will be at increased risk.

Hi,
     Does anyone know of any software that allows packet to be run from a UNIX
box? Specifically, I have an i486 running ESIX SysVr4 and no DOS partition.
Ftp sites would be fine.

Thanks in advance,

Cheers Glenn (VK2ELA)

This should probably be a FAQ entry.

NET (now NOS) began life in late 1985 on an old Xerox 820. I bought a
PC-XT clone shortly thereafter and gave up on CP/M and the 820
forever. (The 820s finally got donated to the local high school
electronics lab back in NJ shortly before I moved to San Diego last
July. Maybe they can use the power supplies for something.) The code
has advanced so far beyond its humble CP/M beginnings that even if I
could figure out a way to read all those old 8" floppies in my garage,
you wouldn't want it. You'd be better off hacking the current code to
fit, or better yet, going out and buying a cheap PC to run the
existing code. Stripped PCs capable of running NOS just don't cost
that much anymore!

Phil

 JK> for an external modem.

Have been using them for years and years. The THS software that comes with them is one of the best packages on the market. The TNC works fine and you can do quite a bit of experimenting with the other port.

 JK> How do the DRSI TNCs compare with AEA's PK-88 (and its plug-in

Less money I believe sure is nice to have no power supply and to have all the stuff in the computer. Did have a problem with a 33 Mhz 386 putting out so much garbage couldn't run the DRSI kept it locked in transmit.

I've been a ham for about eight months and have worked CW on HF
exclusively, but I'm interested in VHF and I hope eventually to get
started with packet radio. I'm going to a hamfest on Saturday (1/18)
and I'm hoping I'll find a good deal on a used 2-meter transceiver of
some sort. Can anyone out there offer some friendly advice concerning
things I should look for (or avoid like the plague), e.g., specific
used makes/models; functionality; etc.?

Any wisdom you can supply will be greatly appreciated. E-mail replies
are fine.

[Is there a FAQ for this sort of question?]

A mate of mine is having trouble getting the Alinco 560 dual-band
to work on packet. He says the transmitted audio, when monitored on
another receiver, sounds way down in level, but is known to work with
another transceiver.

Is there anything "special" about the microphone circuit? I questioned him
about the rig (I've never seen it) and he says the spkr/mic socket uses
separate connections for the mic and the PTT (it's a 2.5mm stereo socket,
with a separate 3.5mm socket for the speaker) which is not what I would
have expected - most hand-helds these days "double up" on the mic/PTT in
many and various ways.

So, what to look for?

[Yes - I reminded him to defeat the battery-saver as well :-)]

Many thanks to those who helped me get my FT-470 working
with the BayCom kit from A&A Engineering.

The 10K resistor at R10 needed to be replaced with a 1K
resistor. With that change, the modem can now key the
PTT on the 470.

avoid anything with relays in it. Also, a synthesized rig may be worth the
extra $$. Remember to consider the price of crystals when you are looking
at a rock bound rig (about $10-14 a pair).

I have been able to carry on several good PBBS
QSOs using an Icom W2A, a ProComm Handipacket,
and a Toshiba 1000SE using a dumb terminal
program and cables supplied by ProComm.

The volume knob for the appropriate band needs
to be at about 90 degrees clockwise of "off,"
the battery save ratio needs to be OFF and the
squelch setting is pretty inconsequential.

This setup msetup makkes a ompact battery
operated package; it might be considered for
emergency BBS traffic.

```

To summarize my mods to the K9NG modem:

Data-derived RX Clock may be derived from U4 pin 9.

Half an LS02 can be used to buffer and gate RXD and RXC with DCD/, which will really cut down on the number of frame aborts in the switch or TNC.

R31 should be changed to 0 ohms, and C18 should be increased to .1 uF to improve the DCD circuit. Cuts down on chattering.

If you don't have a 16x or 32x clock available, a 4060 and a 4.9152MHz crystal will get you one for about $3 total.

At 4800 bps, no changes are needed to the input RCV Filter, but at 9600 bps, the capacitor values are quite critical because the low-pass filter cutoff is too close to 4800 Hz. If your radio has a decent IF, you can just cut the values down and you'll get fewer damaged received packets. (In fact, what I do is reduce C13/14 from a parallel combination of 2700 and 1800 pf to just the 2700 pf, and use the single 1800 pf left over instead of C15/16, which used to be 2200pf + 56pf.)

Change C19, a 220uF capacitor, to something like 6uF to avoid frying the regulator.

For a TNC-2, jumper the modem header pin 3 to pin 4 so that Net/Rom can find itself. Don't cut the jumper on 9-10, so that the keying circuit inside the TNC will continue to work. Do cut the jumper on 7-8. Putting a jumper across 1-2 will let the DCD light on the TNC work.

Hanging a diode from U2 pin 6 to the RTS/ line (solder it from the right-hand side of R26 to the right-hand side of D3) will inhibit the DCD/ output while you're transmitting, which might confuse things. Note that because of the hang time of the DCD circuit, you WILL get a brief burst of DCD after you unkey, but that's unlikely to cause any problems even in a critical device driver, since you will have already told the interface to deassert RTS/, and presumably you're therefore ready for incoming carriers.

Oh, and of course you can leave out all the stuff after U6 pin 10 and U2 pin 14. That's all just DC switching stuff that you won't need if you're using the TNC's PTT or some external PTT. If you are using the modem without a TNC, you can use U6 pin 10 to drive a transistor, or a 555 and a transistor if you need a blab-off.

To turn the modem into an FSK regenerator for real-time digital repeating, cut the trace from U7-1 to U8-13, and connect U7-1 to U2-2. That will push received data up the transmit modulation channel whenever RTS/ is not asserted.

     - Brian

Some questions about interfacing the K9NG modems:

1. Does anyone know how to connect a K9NG or G3RUH modem to any of the
following radios?

Wilson T-1405 SM
Yaesu FT-207
Kenwood TR-7400A
ICOM IC-3200A

2. Has anyone come up with a generic circuit that generates an FM signal

from a K9NG/G3RUH modem at some intermediate frequency (user-settable of course)? The resulting signal could then be injected into the mixer of a radio through a pot and coupling capacitor. I know the WA4DSY modem already does this but I'm looking for something that can talk at 9600 BAUD to other K9NG/G3RUH modems.

A guy in our club is running aa AA4RE PBBS and is trying to implement the dial-in port. He's using an internal 2400bps modem but is having problems with it. It works fine when dialing out but when dialing in, the call appears to never be answered. On the system side, it appears that the call is answered but hung up almost immediately, so fast that the caller is not aware of it. With other software instead of the AA4RE package, such as QMODEM or Procomm, the modem works fine. I suspect there is a delay parameter that is not correctly set in the AA4RE package but we can't find anything in the documentation to support that.

Does anyone have any suggestions? Any help will be greatly appreciated.

Thanks and 73... Mark KG7JL email: markm@mesasrv1.sps.mot.com

Attention Amateurs with an interest in solar/emergency power for their rigs! A potentially great deal just came in the current Damark "remainders" catalog today:

"Solar-Powered Patio Light" (p. 12)

contains:

10 watt solar panel 1 x 3 ft
72 watt/h lead acid gel battery
plus a 7 watt PL light and mounting hardware
has remote and auto-on modes

The voltages weren't specified, nor did it say whether the battery is diode-protected or not, but assuming the components have a reasonable lifetime, the price of $69.99 plus $12 s/h per unit is pretty damn good. Since the unit is designed to live outdoors, the

components are probably somewhat sturdier
and better protected than units intended otherwise.

I might pay the same price alone for an extra
battery for my HT that has 1/10 the mAh rating
of the gel cell alone; the solar panel and the
claimed 40-w equivalent light and hardware are "free."

I ordered two of them (I have no idea if the units
are good quality or not, but at least Damark has a
30-day warranty: beats "as-is" hamfest stuff).

I figure with two units I can perpetually keep
my HT/TNC on the air on a 500mw setting, assuming
a 1 minute xmit, 1 minute rx, and 8 minutes
standing by duty cycle, as well as run my notebook
for several hours a day.

If you are interested, the item number is
B-484-2000390 in the Feb 92 Damark
catalog: 1-800-729-9000 24h/7 days.

[Usual disclaimers: plus, if the units are garbage,
the only satisfaction you'll get from me is knowing
I got burned with _two_ units. :-)]

I will be purchasing the Kantronics DataEngine / 9600 baud modem in the very
near future. I would be interested in hearing from anyone with experience
with this combination.

I also understand a list was posted a few weeks ago with the radios that are
compatible with the G3RUH style modem. Can anyone email it to me, or tell me

if the Icom IC-290H was on it?

Thanks,

David

As someone pointed out a few days ago, the executable for AmigaNOS 2.8m
is now available on ucsd.edu ("/hamradio/incoming/amiga/amiganos2.8m) ,
I believe.

I would like to rewrite amiganos2.8m so that elm is called instead of
the rather braindead bbs program. Could someone that has the source
code for amiganos2.8m (Ie. G1YYH) please upload it to ucsd.edu, or tell me where
else I can obtain it from? If G1YYH is subscribed to this listserv,
could you please also tell me if any releases past version 2.8m are
planned to be release soon?

Thanks,

73/55

>really doesn't hurt to have a relay switched radio. Also, synthesized
>radios usually require a fairly long time for the receiver to start
>working after transmitting; this is a killer for throughout.

   I looked at the GE MVP service manual last night. The transmit PTT
circuit allows a 20 mS delay for the T/R relay to switch before starting
the transmitter up. I suspect this is conservative, that the relay is
even faster (10-15 mS). I suspect the oscillator startup time is maybe
20 mS; the overall transmit delay for this old relay switched radio
is about 40 mS; this is maybe 4 times faster than a common PLL
synthesized radio.

  So? Don't be afraid of relays. Be more afraid of PLL synthesizers.
What is the *real* problem with a long transmit delay, anyway?

  Simple: from the time your TNC decides the channel is clear and
activates PTT until the transmitter actually emits a coherent signal,
you are prone to a collision with another station. Rather like hidden
transmitter syndrome, in this case the transmitter is hidden behind
the time delay for the PLL synthesizer to settle down. Every station
can hear every other station perfectly, but you'll still have collisions
if it takes a long time to capture the channel.

At least two hams are using PLL rigs and doing quite well :-) and they
don't have to buy endless pairs of expensive rocks every time the
local "evil C-word" group changes their mind. 1200 baud Bell 202 AFSK
is just not that critical, considering that it's inherently flawed.

Not all PLL's are as slow as you seem to indicate. My Icom 290H (PLL
PIN diode switched multimode) works just fine at TXD 3 (30 mS), which
is as fast as we've been able to get any rig - rockbounders included.
In fact, _some_ crystal controlled rigs are absolutely pathetic
regarding TR turnaround time.

The absolute here is that there ain't no absolutes.

It's not good to run txdelay at the minimum, though - the rigs need
time to stabilize (on both ends), and the BER suffers if you cut it
too close. A bit error is every bit as bad as a collision.

We've found that TXD 10 at 9600 baud, and txd 30 to 40 at 1200, seems
to work best with most stations, and the extra TXD does not contribute
to collisions. Remember - even though you're not broadcasting "data",
you're broadcasting a signal that will activate DCD, or in the case of
1200 baud non-MFJ modems, will activate the noise detector electro-
junk they laughably call "DCD".

.. and I don't want to hear about Kantronics "software CD" - I wasted
$30 on v3.0 ROMs to get that feature. It works - in fact, so well
that some competing TNC's are not heard! Cheap shot. I've since
turned that abomination off and reinstalled my TAPR DCD state machine.

You're right about relays - unless you mute them with marshmallows, they won't make more than txd 1 worth of difference - and I'm grudgingly conceding that! Just because they're mechanical doesn't make them ridiculous. I still use relays in some of my designs. They're much more forgiving of indiscretions. However, XYL's have expressed a definite preference for PIN diodes over relays at 3 AM when the local insomniac is banging away at your station.

In an effort to "wean" people away from 1200 bps operation, I'm thinking
of establishing a 2400 bps port on our BBS. These upgrades are readily
available, and require no special connections to the radio. As an aside,
I'm pleased that the various manufacturers seem to use the same modulation
technique - they probably all use the same modem chip I guess. I realise
there are "chicken and egg" issues here, in that there's not much point in
providing a service if it gets little use, bt I'll take that risk.

Anyway, how compatible are the two modes? Can they co-exist on the one
channel (permitting me to use a common transceiver), or won't they "see"
each other? I'm trying to avoid using "squelch" carrier-detect, in favour
of modem energy or bit-transition.

Note for Australian readers: what would be a good channel to use, to establish
a "de-facto" standard in the event the modes are incompatible? Most of the
channels are "flat out" with 1200 operation, with some 4800 work on 144.800.

Note for non-Australian readers: I realise that Australia is quite backward
in packet operation, due to ossified thinking, but some of us are trying to
do something about it. Those 1200 bps "network links" are a joke!!! As
for 56k bps operation etc, don't even ask...

Hello.

I am interested in getting into amateur radio, particularly in hooking up HAM equipment to a computer, and having access to Internet. I found your 'address' in an Internet resource guide, and in the comments it specified that your address is geared to the promotion of packet radio.

Currently, in my search for a public access site into the Internet, I have been spending quite a lot of money; I've contacted sites in California, Massachusetts, and several other places, causing my long distance bills to become quite a liability! I'm now using a site in Ottawa, still a good distance (in terms of money) from me. It seems the only way I'm going to enjoy low-cost or no-cost access to the Internet in this area of Canada is to do it with a HAM setup.

I have the opportunity to purchase some old HAM equipment at what appears to be a reasonable cost...but, like I said, it's old (vacuum tube technology). Do you think that a setup like this would be adequate for computer linkup, or would I experience much drift from not having electronic tuners? What kinds of methods are used to hook the radio to the computer? How does one actually reach another node? Also, I am an apartment dweller; how far can you go with a balcony antenna? What kind of licence is required, etc...

I have an Intel 80386SX @ 16MHz with 120 MEG of hard disk space, VGA, as well as an old 8088 XT with 20 MEG of hard disk space connected to the 386 via the Lantastic LAN cards from Artisoft.

What I'm interested in doing is primarily e-mail, however I'd be *very* keen on doing FTP/telnet, newsfeeds, and Inter-Relay Chat as well, provided that was possible.

I haven't had much luck finding people who have hooked their computers up to the Internet via HAM and TCP/IP; so you can imagine I'm pretty naive about this subject at the moment. From the people I have talked to, I have received disturbing replies such as, "It is illegal to use HAM for purposes of evading phone toll-charges" and "Although Packet Radio can be used to transmit data, it is illegal to operate a gateway". I'm not convinced, there is clear evidence of these gateways in operation (otherwise I would not have been successful reaching you)! Could you please send me any information you think I might require?

Thanks in advance,

Steve Frampton

I just picked up a TR22C and a TR33C for a whopping $40. My plan is
to use the TR22C as a packet station since it has adequate power to
hit the local BBS that I use. I don't have the manual for the TR22,
but the TR33 states a frequency range of 146-148. Since both are
crystal controlled, am I going to have a problem running the 22 at
144.93?

Also, does the TR22 have sufficient TX turnaround to be a reasonable
packet station?

Way back in 1983 or so, I was one of the first packet stations on the
air in NNJ, and I used a TR22C. I did have to modify the receiver to
reduce the T-to-R recovery time. As I recall, a voltage was injected
into the squelch detector circuit while in transmit to ensure that the
audio output stages were muted. It took a long time (hundreds of
milliseconds) for this voltage to decay after switching back to
receive.

Clipping the wire that injected the transmit voltage resulted in a
very fast receiver recovery time. It also caused the radio to receive
its own transmissions, but this didn't cause any problems. (Just don't
try to use the radio for voice, or if you do, turn down the AF gain
before transmitting to avoid feedback.)

Many other radios have similarly long receiver recovery times, and
they can often be fixed in similar ways.

Phil

Ahhh... I was wondering why my KPC-2400 could dig some signals out of
the mud, yet ignore others that were fully-quieting... Maybe I'll try
fiddling with the "SWP" command some more.

I have had a couple of relays "gum up" on me though. Not the antenna
change-over, but the Rx/Tx supply - I guess the contacts don't carry
enough "wetting" current to keep them clean. If it keeps up, I'll put
in some sort of a transistor switch.

I have put AmigaNOS v2.8o in the public directory on 130.88.202.27, both
source and executables are stored as self-extracting archives.

     asrc28o.sxa   sources
     anos28o.sxa   executable

     (sxa - Self eXtracting Archive, I made that up myself!)

I will have a lot of work on this year, doing 2 Open-University courses
alongside my normal job, so I anticipate having trouble keeping up with the

changes in NOS.

Cheers, John.

Why avoid anything with relays in it? Because they make noise? Because the result in longer transmit delay times? I'll take relays over PLL synthesizers any day of the week. I don't think radios with relay T/R switches are that slow, anyway.

For packet, I would strongly suggest avoiding a synthesized radio. Very strongly. Most synthesized radios require more than 100 mS for transmit delay time. My Kenwood TR-2600A HT requires about 150 mS from the time PTT is active until RF starts coming out of the antenna connector. A crystal radio is much faster. My old TR-22 requires maybe 20 mS from PTT to have full RF. This 20 mS represents the time it takes the 12 Mhz xtal oscillator to start up. If a radio is relay switched, my guess is that the relay switches and the oscillator starts up in parallel; i.e., it really doesn't hurt to have a relay switched radio. Also, synthesized radios usually require a fairly long time for the receiver to start working after transmitting; this is a killer for throughout.

Note: My TR-22 receiver is quite poor, with poor sensitivity and poor intermodulation characteristics and poor overload characteristics. I only use it cause it is convienent. I plan to replace it soon with a much superior radio.

To get started, you will want a synthesized radio to find out which frequencies have the most activity. If you're like me, you'll find that a few frequencies are active. Buy crystals for those channels and put them in a good crystal radio, and dedicate that radio to packet. Use the synthesized radio for chatting about the no-code license :-).

I'd recommend buying a surplus commercial radio for packet. Like a GE Mastr, GE MVP, Motorola Micor, Mitrek, etc. Be sure to get one that covers your band of interest; Micors, for instance, come in 138-150 and 150-174 Mhz flavors. It is really a hassle to convert a 150-174 radio to 2m; most people can't do it. Look for these kinds of radios at swap meets. Haggle on the price. Basically, you want to pay as little as possible for them. The GE MVP is attractive because it is a one piece unit, while most of the others are control head/radio combos. You often don't need a control head for packet. Look for radios that offer multiple channels. Disable the CTCSS options if they are present. Consider taking the packet output directly from the discriminator output if possible.

Besides being cheap, the commercial gear is built like tanks. Very rugged. The receivers are often moderately sensitive, but exceptionally immune to intermodulation and overload. They make the modern stuff look stupid in terms of selectivity and overload performance. Put a good GaAs FET preamp on a commercial radio, and it will kick tail on any amateur gear.

Synthesized radios do not *necessarily* have long T/R switching times;
it depends on the design. Many FM-only radios program their PLL
synthesizers to produce signals that can be multiplied to the first LO
frequency in receive mode (channel frequency +/- 1st IF). In transmit,
the synthesizers are swung up or down by the 1st IF (typically 10.7
MHz), FMed by transmitted voice (usually by direct injection into the
VCO control line) and then multiplied to the channel frequency. It's
this shift in PLL frequency between transmit and receive that can
cause the radios to take a while to key up or to recover their
receivers.

But some radios (notably most all-mode rigs) leave the PLL alone.
Since they generate their transmit signals at IF and heterodyne them
up to the channel frequency, there is no need for a "swinging"
synthesizer.

One sometimes reliable way to tell if you have a radio that swings its
synthesizer PLL between transmit and receive is to key it up while
closely listening to it on another FM receiver. If you hear a
"Pingggg....." sound at keyup, chances are your radio does indeed
swing its PLL, and it may have problems keying up rapidly enough for
packet use. The "ping" is the PLL's dynamic response to the step
function that is applied to its loop when it is switched to the
transmit mode.

One of these days we'll have DDS (direct digital synthesis) in all our

radios and this problem will go away...

Hello,

I am not on packet, but would like to be able to send mail to a friend
N3CWG at the K3PZN bbs. I believe the address is N3CWG@K3PZN.MD.USA.NA

Could someone please describe how to send email there using one of the
internet <-> packet 'wormholes' ? I don't suppose this would be of general
interest to the group, so email is encouraged.

Also, on a semi-related topic, if I cannot get through on packet, he has
an account on compuserve of 72571,3437. Does anyone know if I can send an
email message to him there ? From what name servers are telling me,
compuserve is on the net, but I'm at a loss as to how to specify the
userid.. has anyone done this ?

Thanks for your time.

My thanks to everyone who responded. I have upgraded the RAM to 32K and
1.1.7b now works great. Of course, there is still one problem. Even after
re-calibration, the TNC-2 refuses to decode signals coming from 2 different
7910 based TNCs. I am currently using IC-2AT radios. Could it be that the
HTs are not flat enough across the audio bandwidth?? Is there any kind of
processing I could put together to make this combination work??

Thanks again.

Maybe the best way to deal with naughty messages would be to replace the contents of the offensive message with 'Censored by K0XXX.'

That way the guys sending the bad messages will know whose machines NOT to use. Otherwise they might figure the system is just flakey.

Ora,

I can answer some of your questions - I own L.L. Grace.

The DSP-12 has a 12-bit ADC and DAC connected to the DSP processor. These units have sampling rates of 100k samples/second. The A-to-D option connected to the V40 is for telemetry and lower-quality (not toll PCM) digitized voice work that I have some interest in.

The DSP memory is fixed at 4k words in P/X space and 4k words in Y space.
These have proven adequate for our needs so far. Sorry about the
lack of capitalization; the DSP processor does run at 24 megahertz.

Typical PCM is 64,000 bits/second. One megabyte of ram is 8 megabits.
The DSP-12 can store 2.18 minutes of PCM toll quality voice data. In
planning the memory I assumed ADPCM at 26k samples/second; not toll
quality but certainly adequate for SSB and mailbox work.

Please let me know if I can help with further questions. I'm more readily
available on CompuServe: 72677,1107.

Brooks

I've decided that I want to get into packet radio. At first I was
going to buy a TNC. I decided on the PK232 because of it's large
popularity. I've since changed my mind though. I'm going to build
the Poor Man's Packet modem instead. This will give me a chance
to get my feet wet and to see if I really want to spend $300 or
so on a mulitmode TNC.

Here's the question I have: How many people out there have
successfully built the Poor Man's Packet modem? I have all the
parts I need except for the 4.433619 MHz european colorburst freq.
crystal. I'm having a really hard time finding it. Does anyone
have some suggestions as to where to find them?

286 motherboards are now down to less than $70. Or you can run NOS under
Desqview (as do many users who need to do other things while running
their networks). The argument that it's too expensive to dedicate computer
equipment to running a network node is fading fast.

There are important reasons that relaying isn't done in cellular phone
systems. One is the fact that cellular telephone systems are a
commercial service, and requiring customers to rely on other customers
would be hard to sell. But the real reason is delay: all this relaying
takes time, and voice is a delay-sensitive service. But data is
different. In the data applications that consume most of the bandwidth

(e.g., file transfer) throughput is more important than low delay, and
here relaying makes a lot of sense.

|> Power control or no power control, your throughout WILL decrease

Nothing whatsoever says I have to run stock AX.25. At the very least,
I'll need to add fields to carry "S-meter" readings to help the
power control process. In fact, I'll probably come up with a completely
new protocol, one specifically tailored for packet radio (unlike AX.25).
It'll be no big deal to get around the window size restrictions at the
same time.

|> Try figuring your probability of collision if you have a dense grid

|> winner.

If you have a dense grid, then the average spacing between nodes will
be smaller. That means each node will use less power on the average
(since most will be routing through their closest neighbors), therefore
the total system capacity goes UP.

|> everybody loses.

No, the way the routing algorithm works, the hilltop sites are used only if a more direct (i.e., less QRMing) path doesn't exist. In this case you're not wasting anything.

I should explain. Current routing algorithms usually minimize the number of hops between source and destination. Sometimes these choices can be influenced by manually set preferences or weights. But I argue that in a single-frequency relay network with power control, this is not the right thing to do (except perhaps for emergency traffic). What you *really* want to do is to minimize the total number of active receivers that have to be captured in order to send a given packet between points A and B.

To do this, each node first builds a power control table: how many dbW it takes to reach each of its neighbors. Then knowing the capture ratio of the modulation method in use, the nodes can compute how many of those neighbors it will have to capture in order to reach a given neighbor. *That* becomes the routing metric. For example, let's assume a capture ratio of 10 dB (I know, a little small, but it's just a round number for the sake of illustration). Say I have a neighbor table like this:

neighbor	power
WB6HHV	-20 dbW
WB6CYT	0 dbW
KA6IQA	+20 dbW
N6NKF	+10 dbW
KB5MU	+10 dbW

Talking to WB6HHV (who is very close by) takes so little power that I would be well below the other stations' noise floors. Therefore I mark his entry with a metric of "1" (only one receiver need be captured to talk to WB6HHV: WB6HHV itself). But talking to WB6CYT, who is a little farther away, requires 20dB more power. Talking to WB6CYT therefore requires that I also capture WB6HHV's receiver, but I'm still low enough to not bother the other three stations. So WB6CYT's metric is 2. Talking to N6NKF or KB5MU (who are farther away still) requires that I capture 4 receivers, so both have metrics of 4. And KA6IQA is behind a hill, so I really have to crank up the wick to reach him. His metric is 5 (I have to capture ALL of my receivers to reach him.)

It is the sum of these metrics all across the network that you want

your routing algorithm to automatically minimize. Strictly speaking,
you are only worried about *active* stations; capturing the receiver
of an idle station causes no harm. So some sort of activity measurement
needs to be exchanged between neighbors so weights can be applied. It's
a complex algorithm, but I think it's doable.

Yes, you do halve the throughput, but remember you're only using half
the spectrum of the full duplex repeater. Let's compare apples and
apples here! Also remember that what I'm trying to maximize is the
total throughput of the entire network, not the throughput of any
given pair of users. These often are in conflict.

Phil

Good points -- that's why I think it's still worthwhile to solve the
problems of the single-frequency, store-and-forward relay network!

PMP uses serial lines. If there are similiar parallel options on the mac
(one interrupt, couple inputs, and couple outputs) it ought to be a piece
of cake. I have never worked on the mac, but I understand how PMP works.
The only requirment for serial was optional power. I figured my laptop
was taxed enough, and decided to take the hit with weight, and added a 9V
battery to the PMP case.

The code is readable, and works really well.

If anyone has a Mac, maybe we can work on this together.

Sorry to ask some technical questions in the midst of the simplex/duplex
wars, but ... :-)

A mate of mine is building his own KISS TNC, based on a one-chip micro, and
although having nothing to do with KISS the following questions popped up:

The "blue book" (AX.25 etc etc version 2.0) says that the I field can be
uo to 256 octets long. Shouldn't that be 255? A byte-count can then be
used internally. The protocol doesn't seem to disallow zero-length I frames,
and indeed they could be useful, to signify EOF etc (a la Unix).

The Oracle also spake that the ABORT sequence is at least 15 `1' bits, sans
bit-stuffing. I take it the receiver only has to see 7 `1' bits, to actually
abort (I think the 8530 SCC chip does this), so this would guarantee reception
of the sequence, no matter when you started counting.

I am interested in this poor man's pocket modem. Where can I find information.
 I'm currently using a KAM, and am trying to go VERY portable with my station,
i.e. a handheld and probably an HP-95LX, and the KAM is the biggest unit.

Also, does anyone know anything about the tiny-TNC? Apparently it was small
enough to be placed in some handhelds, although I dont know if this was
actually done. Is this the same thing as the poor man's?

Thanks,
JT

>sort of software as well as the pc ......

Not that I know of. However, Macs use an 8530 for their serial ports;
they do HDLC in hardware. No need to do 'bit banging' like PMP or
Baycom.

Several years ago I hacked one of the 8530 drivers in an old version
of Net to run on the Mac, but never got it working reliably.

>Also, has ayone played with running the above pc packages on a mac using
>SoftPC ??

I suspect that this would not work. Baycom uses outputs that the Mac
doesn't have (DTR and RTS, but the Mac only has one output handshaking
line), and PMP uses the parallel port.

>Im am totally unfamiliar with the requirements that the Baycom and PMP modems

The PMP modem interface is TTL so you'd have to shift levels. A
Baycom modem should work, though.

Apple's MIDI interface gets power from the differential transmit data
lines by through a fullwave diode bridge. This might work if the
modem doesn't require too much current to run.

I cannot help you right offhad with their address, but Paccomms phone
number is (813) 874-2980.

Theyre in a suburb of Tampa, Florida.

Yes I understand that, but it takes only *one* active station needing
the services of a high site to corrupt the entire network scheme. I
know that around here that would be always the case.

>To do this, each node first builds a power control table: how many dbW
>it takes to reach each of its neighbors. Then knowing the capture
>ratio of the modulation method in use, the nodes can compute how many
>of those neighbors it will have to capture in order to reach a given
>neighbor. *That* becomes the routing metric.

That's going to be a difficult and very dynamic table to build with
near continous realtime measurement and reporting required. How
much bandwidth is going to be taken up passing capture ratio statistics
back and forth as different stations asynchronously become active users
of the channel? A static table would be fairly useless to a busy LAN.
The calculation is going to have to be done in depth across the entire
path. It does no good to forward through three users who each capture
only a few receivers when the third station must resort to a high site
to reach the next step in the chain. A dynamic map of the entire
network must be kept for every possible route. Solving n-way routing
is not simple. For any nontrivial net the geometric complexity quickly
approaches that of a chess game.

PMP doesn't use the serial port - it bangs on the parallel (printer) port.
And Baycom (as I recall) doesn't actually use the serial port as such either -
it makes use of the RTS/CTS lines (I think).

Reason: packet transmissions are not your usual 8-bit asynchronous bytes,
despite appearances to the contrary. It is actually HDLC with NRZI
modulation. Put another way, serial ports won't make any sense of the
bit-stream.

So, if the Mac can toggle its signals on the port fast enough, it can do it
(with appropriate software).

Q: Is there a FAQ list that answers the question of why you can't just plug
a telephone modem into your radio, to work packet? Seems that a number of
people (and I'm not including the gentleman above) think this is the case.

Where can I find a reference as to how the State Machine actually works?
I gather it's just a suitably-programmed EPROM, coupled with a latch, and
fed with the bit-stream from the modem, to produce a clock and/or DCD.

References to it are bountiful, but little actual information. Is the
content of the EPROM a (shudder!) Trade Secret? Or copyright?

I believe that most DC, wall plug powered electronics (TNC's included)
use this power scheme to get immediate UL listing. Many mass marketers
of wall power units have UL listing. DC powered devices (low voltage)
don't require UL listing. This is all basically a liability issue.

We have recently started getting email asking people to send postcards or
business cards to a dying 7-year-old boy named Craig Shergold. I suspect
the same message is going to turn up on ham radio.

I don't think these appeals are genuine, because Craig has apparently been
7 years old ever since the message started circulating in the mid-1980s.
Even if originally genuine, it is now hopelessly out of date.

Further discussion on alt.folklore.urban, which debunks the Craig Shergold
legend regularly.

rec.radio.shortwave:59696 rec.radio.amateur.packet:1675

I just finished a program called SatTrak for the Macintosh. It's

primarily a satellite tracker, but it does much more (see below).
It's targeted towards hams, but others may also find it useful.

It has been posted to comp.binaries.mac and sent to the sumex archives, and should appear in the near future. Requires Mac Plus or better, System 6.0 or better.

SatTrak will

- Generate a detailed, customizable plot of when a particular satellite will be visible from a given location, it's position, altitude, and many other items

- Given operation mode data for a satellite, tells you what mode the satellite is operating in

- Generate a list of satellites currently visible from a given location

- Display (on a world map) a satellites position at any point in time

- Display in real time (on a world map) a satellites current location

- Generate beam headings between two locations

- Find grid identifier (Maidenhead grid locator) of any location

- Generate MUF plots between any two locations for any day

- Generate band openings from a selected location to various points around the world

- Find the line-of-sight distance between antennas at two elevations

- Given a frequency, gives the half and quarter wavelengths, and second and third harmonic frequencies - and shows a simple dipole antenna design (HF or VHF)

- Convert NASA format element sets to Keplerian format

- Print or save windows to a file, copy text or pictures to other programs

- Saves data for up to 200 satellites, 20 ground locations, and mode data for up to 20 satellites

- Preferences (metric or english, UTC or local, data to output)

- Help panels

- Color pictures. System 7 friendly (sorry, no balloon help yet)

(NOTE: Print, copy, and save are disabled in this version. If you pay
the shareware fee, I'll give you a password to enable these functions)

If you can't download from the network, send a floppy (800K or
1.4M) and a prepaid mailer to the following address and I'll send you
the program:

SatTrak

I have a new MFJ1278 multimode controller. I've successfully
used it on every mode except SSTV. Seems most people are sending
72 second pictures, now, and the multicom/MFJ package only
handles 36 sec. max. I have yet to get a recognizable picture
on 14.230/233! I'm not even sure I'm tuning in properly.

Any help/suggestions appreciated.

Why?

A real transport protocol will perform an exponential backoff as it
begins to perform retransmissions. Won't the lack of an ACK do the
same thing as having the TNC tell you it can't transmit the packet?
What will you do differently?

As the owner of two PK-88's, I feel compelled to make a plug for them as excellent starter TNC's. I got my first PK-88 back in 1989 planning to use it with my TRS-80 COCO and MC-10. It worked like a charm. It was hardly any trouble to get hooked up, and the command set was a breeze to learn. Contrary to a myth that has floated around, the PK-88 will operate on HF. Granted, its not as easy to use on HF as the PK-232 with its tuning indicator, but it workes nonetheless. The PK-88 will run as a KISS TNC with no hardware modifications. I am told that it can be modified to work with PacCom's NB-96 G3RUH 9600 baud modem. My only gripe with the PK-88 is a bug in the 1990 revision of the software that prevents the TNC from switching back to command mode after a remote disconnect, regardless of the setting of NEWMODE. I recently installed the DCD state machine modification in one of my TNC'S, and it works wonderfully.

I hope the comments help you in making your decision.

>Is any of this formally documented?

Not really - you need to scan the documentation that comes with the

software that uses these extended features.

I sent Phil some mail a while back asking if he had plans to publish
a "Son of KISS" spec. He did a very good job of evading the question :-)
I am getting concerned about all these unofficial extensions. The
potential for collisions in the use of new KISS commands is much too
high already.

If Phil isn't willing to take on publishing a new spec I will very
reluctantly step into the pit and offer my services ...

When I was at the ARRL Computer Networking Conference this year I heard
someone mention that the FCC eliminated the requirement to use one of the
three "approved" PN sequences. I also remember that they eased a few other
requirements as well, but I don't remember which ones.

Does anyone have more detailed information?

I'm very interested in getting started with 9600 baud packet via the
PACSATS. If I'm not mistaken, this can be done with an FM uplink on both UHF
and VHF and non-directional antennas. I thought about purchasing the Kenwood
241/441 pair for local FM work and I need to know if these xcvrs will work
for PACSAT use ? Also - need feedback on what 9600 baud modem is best suitable
with an AEA PK-232 (G3RUH, Pac-comm, MFJ, TAPR, etc.)
Any comments/sugjestions are welcome.
Thanks es 73,
Rich

But the lack of an ACK means that you should send an RR packet to
interrogate the other end.
To clarify: when the whole protocol is in the TNC and the computer sends a
data packet to the TNC, the TNC transmits the packet when the channel is
clear and then sets a timer. If the timer expires then the TNC usually
will send an RR packet enquiring as to the status of the packet it sent.
If the channel is blocked when it tries to send the RR then it just backs
off and retries the RR later.
But when you put most of the protocol in the computer, it can't see the channel
at all and most implementations I have seen (such as MSYS) have no choice but
to do something like this: send the data packet to the TNC and set a retry
timer in the computer.
If there's no ack by the time the timer expires then either send the packet
again (if it is small) or send the RR packet. If there's no response at the
next retry time then send RR again. It's part of the AX.25 protocol, but
the problem is that KISS splits the protocol into two pieces in such a way
that the computer does not have enough info to behave properly all the time
and this is why (especially on HF) you can see a station send a single
transmission consisting of several RR packets all for the same packet number.
The computer couldn't see that the TNC was not Txing because of a congested
channel and kept timing out and sending the RRs to the TNC which simply
stored them all up until it could finally spit them out.

This is why I prefer the WA8DED protocol over KISS as far as implementation goes because on a per-conection basis WA8DED allows you to interrogate the TNC to find out how many unsent packets it has and thus the computer can send, in the simplest case, one packet per connection and when its retry timer expires it first asks the TNC how many packets it has in the buffer for that connection. If the answer is one, then the computer does nothing because the packet hasn't made it into the aether yet. If the answer is zero and ACK hasn't been received then the computer can send RR (and again interrogate at timer expiration to make sure the RR was sent before stuffing another into the TNC).
KISS has some advantages over WA8DED, such as the fact that it can be found in, or made available for, practically every TNC there is.
But to repeat my earlier statement, the *only* extension I believe is *essential* to KISS is to allow the computer to ask it how many unsent packets it has. This will then allow those who write KISS drivers to make their software handle a clogged channel properly.
Hope I made myself clearer - I'm still recovering from a royal dose of the flu!
Merry Christmas all.

We've discussed several changes to the basic design from time to time, but those common old parts are easy to find and replacing debugged board designs is costly. The three adjustments on the transmit encoder allow you to compensate for a multitude of sins of component tolerances in the entire transmit chain. It does require a simple AF grade scope to get them set right, but you only have to do it once. A gate array could reduce the parts count on the encoder by 2, or an ASIC could reduce the count by 4, but puts you in a single source situation for field replacement parts. Gate arrays wouldn't help on the decoder or RF boards.

THE FOLLOWING IS MY PERSONAL OPINION ONLY, AND DOESN'T REFLECT OFFICAL GRAPES POSITIONS.

A couple of changes that would be worthwhile (IMHO) would be to use a newer DAC chip that includes the latch and output amp, and go to Minicicuits type diode ring balanced modulators so the output could be on-channel instead of at 29 Mhz. This would eliminate the need for a costly external transmit converter, though at the cost of additional buffer stages and a power brick. This would require slightly different RF boards for each band. That reduces the universal appeal of the modem somewhat, but with the problem of locating suitable transverters being what it is, I think it's a good idea.

The major drawback to eliminating the 455 khz stage in receive is the necessity for a band filter with the proper group delay. This was a major stumbling block in the original design. By good fortune, it was possible to design a filter with the desired characteristics at 455 khz with off the shelf parts. Tektronix is showing an integrated filter with the proper characteristics at 10.7 Mhz, but the order quantities required are unreasonable for us and being stuck with a single source part is another consideration. If a good, readily available, filter design comes along, then eliminating the 455 khz stage is feasible. Staying with the theme of on-channel operation, the first mixer could be changed to operate at channel frequency and a helically filtered preamp, like the nice Hamtronics units, could form the front end. Single conversion to 10.7 Mhz from UHF would be prone to image problems though.

Changing the boards to surface mount, and constructing a motherboard to eliminate the harness and house an on board power supply would simplify packaging problems and reduce the size of the modem. The modular nature of the original design was deliberate, however. It allows for wide flexibility in operations. The transmit and receive chains can be totally separated for split site or crossband usage. The original choice of 29 Mhz for the modem input and output pushed the more difficult RF circuitry onto an external transverter and allowed one modem design to be used on any band for which a transverter

was available. With the advent of MMIC UHF amplifiers and packaged mixers, and with the decline in availability of cheap transverters, integrating the on-channel electronics into the RF board begins to look attractive. But we don't want to destroy the modular nature of the unit completely, so some duplication of circuitry is inevitable. We also have to keep in mind the grade of test equipment available to people putting the kits together. Today, only a modest performance scope is required. If we start putting UHF circuitry on the modem, access to a spectrum analyser would become necessary, or at least desirable.

|> What will you do differently?

Furthermore, a real transport protocol will also measure and keep track of the intervals between transmission of a data packet and receipt of the corresponding ACK, and it will set its retransmission timeout appropriately. TCP has done this since day 1 (although the algorithms have been steadily refined over the years) and my own AX25 implementation (in NOS) uses the same algorithm.

When the protocol does round-trip timing, it doesn't matter whether the packet is stuck in the local TNC, waiting for the channel to clear, or whether its acknowledgement is stuck in the remote TNC for the same reason (something you can't detect by simply querying the local TNC). It automatically takes into account ALL delays encountered by the packet and its acknowledgement.

As for packets piling up in the TNC because of a busy channel, I'm coming more and more to the conclusion that, on simplex channels at least, "data carrier detect" is at best useless and more often actually counterproductive to the full, efficient use of the channel. I.e., CSMA just doesn't work.

Of course, it will take new channel access protocols and algorithms to deal with this, and that's another subject.

I have a strange problem with a Heath pocket tnc. The thing seems to work ok when monitering the local packet, but when I connect to a local BBS here is what I get:

****

c wb2wxq
*** CONNECTED to WB2WXQ
Hi Mark! Welcome to ROCBBS! BBS moved back to Kodak Park on 11/14
Please leave a note to the SysOp with a signal report. Thanks!

Type H if you need Help>
l
*** DISCONNECTED

****

It seems that a carrage return will cause it to disconnect.
I am thinking that I have something set up wrong in its setup, and am hoping that someone has an answer.

Thanks.

Has anyone looked into updating the DSY design? It's reasonably sound, but it uses really old chips. It seems to me that the design could be updated to make use of newer chips and yield a greatly reduced component count. Perhaps we could even convince some grad student studying VLSI design to make up a custom chip, perhaps a gate-array/ASIC to do all the digital stuff, and use some newer analog stuff to cut 'way down on the number of parts.

A few simple changes occur to me - it's perhaps possible to use some other type of modulator which would require fewer adjustments, and the demodulation might well be done at 10.7 MHz, thus eliminating another conversion step, crystal oscillator, filter, etc.

Any takers?

I tend to vote with Phil here.   The issue is not whether there should be an
extended KISS spec: It obviously already exists. What is actually the issue
is what it is, since Phil is correct. IT AIN'T KISS, because it's no longer
"simple".

Using the hardware options, where available, is one obvious approach. The
other is for BPQ and others to identify the "extensions", codify them, and
write the extensions into a nwe code set. If they persist in calling it a
KISS extension, then it MUST be backward compatible. If it's not called
"KISS-something" then that requirement can be waived.

Let's use KISS for what it was intended for, and not take the original author
to task for taking a position that's easy to understand and defend.

73, Gerry

If you do publish a new spec, you should call it something other than
"KISS", since that description (Keep It Simple Stupid) would no longer

apply. The whole purpose behind KISS was to provide the *bare minimum* of hooks to allow a PC without an HDLC interface to use a TNC to generate and receive arbitrary HDLC frames. Flow control, polling and ACKing were (and are) very much against the KISS principle, and Mike (K3MC) and I deliberately excluded them. They really don't belong there.

Checksumming is about the only feature that I might even think about adding to the KISS TNC spec were I to do it all over again. The wire between the host and TNC typically does have a low error rate, but unfortunately people have been trying to use KISS TNCs with programs and hardware that isn't quite up to handling solid 9600 bps (or whatever) input streams. Occasionally characters are lost and people blame the KISS TNC for this when of course the fault is elsewhere. Also, KISS was primarily intended for TCP/IP, which has its own header checksums.

And of course KISS was only meant as a stopgap hack until true HDLC interfaces became available. They are now available, at least for the PC, and I strongly advocate that anyone trying to decide between an external KISS TNC and a dedicated HDLC board (e.g., DRSI PCPA, PACCOMM PC-100, etc) opt for the latter.

I have tested a conglomeration of misc. antennas including a Ringo, 1/4 wave whip, turnstyle, dual 11 elem cushcraft yagis with different polarization, etc. None of these have given very good response. I know that my next purchase needs to be a mast mounted GASfet amp. However, I would like to try the J-pole routne, too.
>
> I have both azimuth + elevation rotors set up now. (crude but, hey,

they work!)

Are there commercial versions of a dual-band (2m/440)
J-pole similar to the AMSAT project antenna? If they weren't too
expensive, I might just order a kit rather than run all over trying to
find the proper materials. Available time for such projects is getting
scarcer and scarcer!

Thanks..

I'm currently running a PK-88 on the local IP network; it does fine, except
for one problem: I can't set the MTU above 984. The TNC throws away any
packets with a data portion longer than 1K. Other folks with true TNC-2 clones
don't have that problem.

Can you elaborate on the design parameters for the existing 455 mHz filter, eg phase chracteristics, passband ripple, etc? This would greatly benefit those of us contemplating doing an update pass on the dsy modem. Although expensive in Q1, Sawtek has a line of both 70 mHz & 140 mHz filters that would allow for a better choice of IF in an "on channel" design.

If you have a tourch and some plumbers flux and solder on hand, the dual-band J-pole can be constructed in less than two hours, and will require less than $10.00 of materials (all new). I built one a few months ago even though I don't have 440 capability. I was extreemly well pleased with the 2 meter performance, and pleasently surprised at how quickly it went together. Oh, yes, I did already have the co-ax and connectors, but most commercial units will not provide them anyway. Give building a try! it's cheap, easy and it works.

Good luck & 73

Personally, I would like to see us follow the IETF model whereby we
set up a working group to define the new spec, then build a reference
implementation to shake out the new protocol, and use our experience
in the field trials to correct any deficiencies in the spec. Once
it's stable we can release the published version of the spec (and
probably a final reference implementation for something like the
TNC-2).

I agree that checksumming was an oversight. Even in its intended
application of sending encapsulated IP frames, the requirement
to send raw AX.25 packets was there from the very beginning (AX.25
ID frames).

When KISS was developed, the state of the art in TNC's was a single
radio port running 2400 baud. KISS was sufficient to handle that.
It's naive to think that the state of the art wouldn't progress,
though, and it has. Part of that advancement has been the introduction
of HDLC hardware interfaces. However the concept of the KISS TNC
was so elegant that it has spawned an enormous install base (vs.
the direct hardware approach). It's not fair to now tell these
people that they must forgo their current TNC interfaces and adopt
a hardware approach when they want capabilities like medium speed
(9600/19200 bps) and multiple ports, soley due to altruistic
considerations.

I, too, don't want to see tons of excess baggage added to KISS, however
there are some very useful extensions to the protocol being proposed
that will significantly help the existing user base achieve better
throughput (having the TNC asynchronously notify the host when it
actually sends a packet over the RF link is a *big* win on busy
channels if the host uses this information to control its retry
timers).

Face it Phil, you've created a monster. Given your experience in
the field, all I can say is "you should have known better" :-)
If you want to freeze KISS as is that's fine by me. I have no
objection to inventing a new protocol, with a new name, that just
happens to be backwards compatible with KISS. Of course, in a few
years I will be kicking myself in the head for having done so.
Such is the price of progress.

And for the record, I too am very much in favour of the hardware
based approach. If it's an option, use it!

Here in Stuttgart, Germany, we have done exactly this. We built a KISS
version, which adds a CRC16 to the frames. The protocol used to switch on
this feature is backwards compatible, so the host can distinguish between
KISS and SMACK (Stuttgart Modified Amateur Checksummed Kiss).

The spec will be published in the near future. Please direct questions

to jan@nasobem.stgt.sub.org, but I won't be able to answer before mid of
january.

>A real transport protocol will perform an exponential backoff as it
>begins to perform retransmissions. Won't the lack of an ACK do the
>same thing as having the TNC tell you it can't transmit the packet?
>What will you do differently?

Well, this issue is a bit clouded. The TNC may, due to channel usage, not
transmit the packet for a long period of time. The software talking to the
TNC does not know if it has not received a ACK because it failed to transmit
yet or if the message failed to propogate. If it failed to transmit, it is
far better to wait. If it failed because of some other reason on the air,
then of course you want a retransmission.

On a busy channel, where your packet may be held for an extended period of
time in the TNC, the link may be dropped, when in fact a bit of patience is
called for. One could argue that it is a bad link (slow). But I think a
timer makes more sense if it starts once the packet is on the air, rather
than when it got to the TNC.

Subject: V29 modemchip Yamaha

Hello,
I would like to get more information and contacts with persons of the japanees group PRUG (especially with jj1bdx & je1waz).
I have seen in digest 277 that they are using a v29 chip from yamaha,
I think it is the ym-7109.
I have send 2 letters to 2 OM's in the USA who are using this chip,connected to the modem disconnect plug of a tnc2c,but i never received any answer.
So i would like to have some contact with the OM's in Japan to get more info and if possible also some layout and schematics of the diagram.

Everyone can reach me via:

- Packet Radio: ON1AOT @ ON6AR
- Personal adres: ON1AOT,Crauwels Walter,Lode Vissenaekenstraat 30,2600 Berchem,
  Belgium,Europe
- Fax: to ON1AOT ++/32/38873571

I will pay every costs for info and documentation.
I have send a lot of dollars to the American OM's but i lost my money !!!

This is a classic problem with HTs. The front ends are made to work only with the standard rubber duckie included with the radio. Anything else in a high RF environment is going to impress so much RF voltage on the front end that it goes crazy. I have had the same problem in my car with an IC2AT. When I went from a 1/4 wave groundplane to one of those LONG collinear antennas, the problem got worse.

I understand the new Radio Shack HT is supposed to avoid this problem, possibly by restricting the coverage to ham band only.

Get a standard radio, and use the HT as an HT....just for carrying around and use with a rubber duckie.

Give me a break. As one of the members of the GRAPES board for several years, I am here to tell you that GRAPES was NOT focused on ?86 machines only. I actually do have an 8088 box. That should come as a surprise to many people, since I also have seven Macintoshes of various flavors, including several 512K boards that I use as servers. I was the first to test a hi-speed TNC with a host link faster than 19.2KB. I have pushed for a KISS TNC that could handle faster rates. I really believe the Z80 technology is way out of data and needs to be replaced with something better. 68302s are now relatively inexpensive. Interesting that Gracilis is the only folks to release one...

To paraphrase WA4DSY, the high-speed RF is here. Where is the digital? And, in this case in particular, where is the high speed digital that can provide synchronization between sent and received bits, with delays, in real time?

                         ^^^^^^^^^^^^
Not even for keyup? Do you leave the TX on all the time, or simply trash the first part of a packet as the TX comes up to power? Or, do you send the "destroyable" header at the beginning of each packet on the channel, thus lowering the effective throughput of the channel? I really suspect that full duplex techniques with CSMA/CA will do far more to resolve any problem of this sort than providing the necessary hardware/software for CSMA/CD. But, of course then we have to put our computers to the task of solving the packet equivalent of the four color map problem...

>order of 5ms in the Gracilis data radio as an example. I expect the
>destroyable header to be in the order of 10ms (10 characters at 9600, 60 at
>56K see more below).
>
>>just wastes channel time. Even the TCP/IP header causes an annoying
>>loss of thruput.
>(That is what Raw IP is for).
>
>>This is not a software problem. Primarily it is a physical problem that
>>needs physical remedies that the speed of light prohibit in reasonable
>>LAN sizes.
>2*(30Miles/186000Miles/sec)*56000bits/sec*(1/8)chars/bit = 2 characters !!!
>speed of light is `there' at 56Kbps, but hardly an issue as compared to
>realizable TX delays of 5ms (35 chars at 56Kbps). However, this is still
>small with respect to the packet sizes I expect to see (greater than 4096 at
>56Kbps, greater than 1024 at 9600).
>
>Next ...

Actually, it sounds like it's time for you to build the hardware and write the paper to prove your point.
>
>Ciao, 73 de VE6MGS/Mark -sk-

Frequently Asked Questions for Amateur Packet Radio

Version 1.5
4 October 1991

This document is for unlimited distribution.

Please send corrections and additions to Steve Schallehn (steve@matt.ksu.ksu.edu). The Packet Radio FAQ's will be posted on a monthly basis to rec.radio.amateur.packet. The current version of this document is available via anonymous FTP at ftp.cs.buffalo.edu.

1.0 Basic Packet Radio Information
- 1.1 What is packet radio?

3.0 Networking and special packet protocols

3.1 Are there any other protocols in use other than AX.25?
3.2 What is TCP/IP?
3.3 Networking Schemes
What are some of those other networking schemes?
Digipeaters
KA-Nodes
NET/ROM
ROSE
3.4 BBS message transfer

1.0 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small burst, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:
Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, 2 amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:
Many cities have a packet Bulletin Board System (BBS) attached to their local packet network. Amateurs can check into the BBS's and read messages from other packet users on almost any topic. BBS's are networked together over the packet network to allow messages to reach a broader audience than your local BBS users. Private messages may also be

sent to other packet operators, either locally or who use other BBSs. BBS's have the latest ARRL, AMSAT, and propagation bulletins. Many BBS's have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:
A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:
With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:
Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBS's (sometimes called mailboxes) so other

amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to simultaneously use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller)

A TNC contains a modem to decode the audio signals into digital signals. It also contains a modem and a micro-computer to convert the digital signals into text that can be sent over a RS-232 port to the computer. The CPU also handles the protocol overhead of the packet station. When you send data, it takes the text, puts error checking on it (CRC) and also puts it in an envelope for sending. When receiving a signal, it takes it out of the envelope, and sends the message to the computer.

Most TNC's use 1200 baud for local UHF/VHF packet and 300 baud for long distance HF packet communications. For VHF/UHF packet, higher speeds modems are available, but often are harder to interface.

Computer or Terminal

This is the user interface. A computer running a terminal program or just a dumb terminal can be used. For computers, any phone modem communications program can be adapted for packet use or customized packet radio programs are available.

A radio

For 1200 baud UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 baud data is used over single side band modulation. For high speed packet (anything greater than 1200 baud), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access) If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the radio keys up and the TNC sends it's packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then

retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25 ?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the senders and recipients amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

HDLC : (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

AX.25 : Amateur X.25 protocol. The basis of most packet systems. See section 1.7.

TAPR : Tucson Amateur packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

digipeater : A packet radio station used for repeating packets. See section 3.3.1 for more information.

digi : Short name for a digipeater

NET/ROM : A scheme for packet radio networking. See section 3.3.3 for more information.

TCP/IP : Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

KA9Q NOS : (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

NODE : A network node. Often a network node running NET/ROM.

KA-Node : A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

CSMA : Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

TNC : Terminal Node Controller. See section 1.5 for more information.

AMPR : Amateur Packet Radio.

44 net : The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format of 44.xxx.xxx.xxx .

ampr.org : The high level domain recognized on Internet for amateur packet radio TCP/IP.

RS-232 : (RS-323C) A standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

protocol : A standard used for intercommunications between different computer systems.

CRC : Cyclical Redundancy Code. The error detection scheme included in each packet. Verify that the packet was received error free.

KISS : Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

modem : Modulator/Demodulator. Converts the analog signals into binary data stream (a series of ones and zeros) for the TNC or a micro-computer . First step in decoding packets.

FCC : Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM : Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

SSB : Single Side Band Modulation. The radio modulation scheme use for HF packet and satellite packet communications.

AFSK : Audio Frequency Shift Keying. A method of representing

digital information by using different audio frequencies modulated on a carrier.

FSK : Frequency Shift Keying. A method of representing digital information by shifting the radio carrier different amounts to represent ones and zeros.

LAN : Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.
[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -Steve]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

> This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.
>
> Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

> Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be pass FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to assure that rules of message content are followed.

It's my license if I send use packet radio illegally anyway, so what does anyone else care!

> Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensees responsibility, one illegal message sent over the packet radio network could literally jeopardize the license of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

> The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.
>
> The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2.0 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The

first line of the mail should be 'SUBSCRIBE groupname yourname'.
Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup):
     General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup):
     General amateur radio discussion. Usually does not contain
     any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup):
     Discussion of regulation policies regarding every aspect of
     amateur radio. Occasionally deals with polices of packet
     coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup):
     General For-Sale for any radio equipment. Occasionally will
     have packet equipment for sale. Recommended location for
     any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group):
     A digest redistribution of the rec.radio.amateur.misc Usenet
     discussion.

packet-radio@ucsd.edu (Listserv group):
     A digest redistribution of the rec.radio.amateur.packet
     Usenet discussion.

ham-policy@ucsd.edu (Listserv group):
     A digest redistribution of the rec.radio.amateur.policy
     Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list):
     Discussion of high speed modems and radios available and
     future plans. Also includes discussion of networking using
     high speed modems.

tcp-group@ucsd.edu (Mailing list):
     Group discussion technical developments of TCP/IP over
     packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (mailing list):
     Discussion of current gateways and future plans for
     gateways. May deal with sensitive internetworking issues.

For all lists at ucsd.edu, archives may be found via anonymous
FTP at ucsd.edu. Some listserv groups also have archives. Send
the command 'help' to the group's listserv for more information.
Digest mailings for the ucsd.edu discussions are also available.
Send mail to listserv@ucsd.edu with the first line being
'longindex' for more information.

2.2 What anonymous FTP sites are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu
: Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information.

wsmr-simtel20.army.mil
: Very large collection of amateur radio software.

wuarchive.wustl.edu
: Mirror site of Simtel20 archives. Unix directory structure - Easier to use then the simtel20 archive.

ftp.cs.buffalo.edu
: Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov
: Packet software including Baycomm, Rose, G8BPQ, NOS, etc.

2.3 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateway

Jim Durham, W2XO, maintains a gateway between Internet and the Packet radio BBS system.

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"
2. Make the first line of the text a Packet BBS "send" command, ie:
   SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL
3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.ps.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NAOM' (Packet BBS mail) with his/her amateur callsign and their Internet address.
2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NAOM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.ps.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3.0 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if it's call was in the digipeater field, it would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections because acknowledgments only carried on one link.

KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM as if connecting to any other packet station. From there, he can issue the NET/ROM commands to instruct it to connect to another user locally or connect to another NET/ROM. This connect then connect again means that to a user's TNC, you are connected to a local station only and it's transmissions does not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM don't use all of the AX.25 protocol. Instead, they use special AX.25 packet called Unnumbered Information (UI) packets and then put their own special protocol on top of AX.25. This is again used to increase efficiency of it's transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network, but if band conditions such as ducting occur, often unreachable nodes are entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

Rose is another networking protocol derived from X.25. Rose nodes have a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

The static routing tables ROSE uses ensures that packet routing does not use unreliable links such as NET/ROM suffers from. However, ROSE suffers from it's inability to change it's routing table as new nodes come on line. The operator must manually change every routing table, thus ROSE networks require greater

maintenance times.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBS's use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBS's, many TNC makers have developed Personal BBS software to allow full service BBS to forward mail directly to the amateurs TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

Has anyone used the KISS EPROM code for the PACCOMM TNC-220 provided by G8BPQ?? I tried it over the weekend and although it receives OK, it seems to be unable to transmit anything. When data comes from the PC to the TNC the LED lights (but not very bright) and the TNC never keys the radio or sends the data.

Anybody have a suggestion to offer?? Is there anyone with contact with G8BPQ who could see if he will make his 220KISS Source available?? I would love to put my old TNC-220 to use, but all I run is TCPIP.

Thanks in advance.

>a suitable, portable, TNC? What features should I be looking for?

Maybe Baycom would be the right answer? It is a software based TNC. The Modem
olnly is hardware, I ahve been working with it for abt 6 months and am very
satisfied. The software is PD.

You are certainly correct. There's an old story about a ham and eggs
breakfast. The chicken was *involved* in producing the breakfast, but
the pig was *committed*. We have a lot of involved amateurs, around 500,
 who get on packet 3 or 4 times a week and attend meetings and pay dues.
Then we have about 30 *committed* amateurs. These guys operate 24 hour
stations, install and maintain high sites, run forwarding BBSs, and
the like. To last, a network design must satisfy the communications
needs of the involved, and not burn out the committed. Our networking
group has about $15,000 a year in operating budget. That has to build,
maintain, and pay utilities and rent for the network. Money hasn't
been the limiting factor, lack of worker manhours has. Looking at
most clubs, I think our experience is typical.

There are a few tterminal emulators out there for the 48; you can find them in
the archives at seq.uncwil.edu. There's an associated mail server, and
instructions on using it are posted regularly to comp.sys.hp48.

Personally, for small packeting, I'd use an HP95LX, a PacComm HandiPacket, and an IC2SAT or similar. Both the TNC and the radio come with belt clips, and the 95 has a nicer keyboard and much larger screen (16x64 instead of 7x22). I may try packeting with my 48 one of these days, but it'd be purely an item of curiosity.

ON1AOT asks for people who are using the Yamaha YM7109 for 9600 packet.

I currently have a couple of these modems here along with a few other people in the Detroit, Michigan area. We have been very busy working on other things with packet and every now and then we mess with the modems. When we finally kick ourselves (or someone else kicks us) to actually finish these things, then we will be posting the results in packet-radio and tcp-group. We do have a printed circuit board made that plugs into the modem disconnect header of a TAPR2 type tnc (like the MFJ-1270/1271, Paccomm TNC200, AEA PK-80, etc...) and Jeff, WB8WKA has a couple of TEKK radios that will probably be used. I have a few boards here and the other ones are at other peoples houses.

The modems do work at 9600 baud and you can just plug it into the microphone jack on the radio. An Icom HT with the common slow squelch even works fine at 9600. Now for those of you that will argue about V29 and the training time, READ THE LATEST CHANGES IN THE CHIP!!! Take everything you know bad about V29 and throw it away, Yamaha has changed things in the chip and you can run without training time.

Let's NOT start any debates about V29, G3RUH, K9NG and whatever else might be out there. When we have these done and we pass out the information for other people to run it, then we can discuss it the differences. Please no arguements on something that you havn't tried or don't have the knowledge for a discussion about. The info WILL be posted for all.

Thank you, Bert, I had meant to make exactly this point myself when I
first saw Gary's posting, but I procrastinated until after the system
had expired his article...

KE4ZV:
> And I think you are missing my point, most users don't leave their
> stations turned on 24 hrs a day and there's no reasonable way to
> force them to do so. That leaves lots of people with *no* connectivity
> most of the time. That's simply unacceptable. Power control is not
> a viable option when you are separated from the nearest active user
> by solid granite.

This doesn't follow. First of all, the reason many users don't leave
their stations on 24 hours per day is because they share their voice
radios with their packet stations. If we could mass produce cheap,
dedicated data radios that weren't useful for FM voice, then more
users might be willing to leave them on all the time. Especially if
there was a good reason to do so, like contributing their share to the
local network infrastructure.

But even if you have users going on and off the air, the network is
designed to adapt. If A and C had been communicating through B, and B
goes off the air, then A and C will attempt to communicate directly
with higher power (or find another intermediate relay) before giving
up. Only if it is impossible to find another path will the network be
partitioned.

Of course, depending on the circumstances you may still want to
establish fixed "utility" nodes. These would be functionally
identical to ordinary user nodes, except that they would be more
likely to be in good locations (e.g., hilltops) and would be supported
by a group rather than an individual. But because these nodes would
likely blanket large geographic areas, it is important that they not
be used simply because they are there if an alternate, more efficient
route is available. They're there just to guarantee connectivity when
routes through intermediate user nodes are not available.

WD6EHR:

>As far as halving thruput with each hop, a system that begins with a

>very high speed can afford to do that.

No, throughput will NOT DECREASE with additional hops! Because power control keeps you from blanketing the entire network with your transmissions, you can "pipeline" your packets down a chain of simplex repeaters. Once one of your packets has propagated out of (relatively short) range, you can launch another before the first one has reached its destination without interfering with it. And since the average transmit power will decrease with an increasing density of nodes, the overall network capacity automatically INCREASES as you put more nodes on the channel. Try doing that with either conventional digipeaters or full duplex repeaters.

Phil

Um, could I get you guys to modify your terminology a bit? As far as I know, NO ONE in amateur packet radio is currently using a CSMA/CA (Carrier Sense Multiple Access with Collision Avoidance) channel access algorithm. I have *proposed* two flavors of such a protocol (MACA and implicit MACA) but neither is in actual use yet (ah, if I only had the time...) CSMA/CA *is* in production use on at least one wired network, Apple's Localtalk. Localtalk and MACA both use use special RTS/CTS messages to enable data transmissions when they are least likely to cause collisions. Implicit MACA works by monitoring traffic sent to other users, avoiding the overhead of special RTS/CTS messages, albeit with an incrased risk of collision. None of these

schemes guarantee no collisions, they just try to reduce their
frequency, particularly on large data packets.

Contemporary simplex packet radio is just CSMA - there is *no*
"collision avoidance" component above and beyond carrier sensing. So
please do not use "CSMA/CA" to refer to it. Thanks!

Granted. Although my comment was a little flip, I still thought it
made a valid point, which is that collisions can still easily occur in
a fully connected CSMA network when several stations are all
contending for the channel when the active one goes clear. Having used
the full duplex voice FM system Brian described recently is very
instructive; you can avoid a lot of wasted time in doubles. And you
can hear all the rude remarks made about you by the other repeater
users. :-)

I shoot my mouth off again and say:
>I based my statement on the fact that KISS56 runs on a 5MHz Z80, I am sure
>a CSMA/CD system can run on a up to 16MHz Z80 (available and cheap, the Z80H

From: jackb@mdd.comm.mot.com (Jack Brindle)
>With extremely expensive support and memory chips...
I figure we do not need to go as far as 16MHz on a Z80, I am just indicating
that a TNC can be made responsible for 9600-19.2Kbps packet. However, there
is not a computer alive (to exagerate the point) that could take KISS on the
serial ports at that rate. My point was to use an appropriately souped up TNC
(regardless of CSMA/CA or CSMA/CD or whatever) to handle the vulgarities of
CSMA/CD on the high speed systems. I also stated that something be set up in
the KISS protocol similar to the Budlist to keep the PC to TNC traffic down
so that a cheapy XT could even be used to handle high speed packet (ie, read
only packets that are destined for me or are broadcasts for everyone to see,
these packets would be filtered at the destroyable header level).

>in this case in particular, where is the high speed digital that can provide
>synchronization between sent and received bits, with delays, in real time?
I was out of line about a 16MHz Z80, but my guess is that a slower Z80 can do
it. I won't put my money where my mouth is 'cause I havn't got any money.
Your point about using a newer processor (68302) is great, but if I want a
quick implementation on a readily available (and cheap) TNC ...

Here I go, opening my trap without putting bwain in gear:
>>the bent pipe repeater has NO delay. There is a TX delay that is in the
>   ^^^^^^^^^^^^
>Not even for keyup? Do you leave the TX on all the time, or simply trash
I should stop using NO delay, 0 delay and other attrocities, and replace it
with neglegible ...

>Or, do you send the "destroyable" header at the beginning of each packet
>on the channel, thus lowering the effective throughput of the channel?
I `figure' the destroyable header would be 10ms long ... negligible (:-O)
with respect to the packet sizes I expect at higher (>9600) speeds.

The problem with CSMA/CA, with the current state of the technology, is I expect it to crumble when the load gets high on the channel. More than two stations are BOUND to key up at the same time right after the channel clears. CSMA/CD was the solution on the hard wired networks to get rid of the problems of scale when CSMA/CA stopped working on a busy network. Sure, some improvements have been made in /CA protocols, but keeping with it, when we can implement /CD is like my arguments to keep using TNC-2s using Z-80s at 56KBaud and beyond ...

A self-centered egotistical quip from me:
>>Next ...
>Actually, it sounds like it's time for you to build the hardware and write
>the paper to prove your point.
Yup, it does, I do not have any research and development funds right now. The central planning commitee (my wife) has vetoed every request for suitable funding. My noise was to prompt someone else to build it before I did. As far as writing the papers, it has been done already and we have been passed by ...

< Pep Talk >
The demand for simplex data radios is there, thus the manufacturers make them. The equivalently priced data radios with separate receive and transmit bands used for implementing Full Duplex and CSMA/CD has no demand, and thus negligable availability. Please request these dual band radios from ANY source that could possibly make them and maybe we can get on to doing bigger and better things. It wouldn't be to hard for them to come out with the product since all they need do is slice up the TX and RX sections on to separate boards and mix and match as the orders require.

I am sure that many have put this subject in the kill list now ...

I see that this digest is getting larger each issue..... Why ?
why do we have to quote the entire mail sent by another person and add

our own comments... and then yet another person to requote the allready
quoted message for the 2nd or 3rd time... and so it goes on. We have archives
of past digests... We can refer to a past subject cant we ?? This is see
as the continued re-quoteing of past mail/messages as a Wast of Bandwidth!!
the last 3 or so packet-radio-digests have been larger than 45 kb some have
been larger than 56-61kb long!! this practice has only seemed to have
appeared in the last 2-3 months so please think of gateway operators
like me... that have to split the last N'th digests into 5 or 6 parts
before re mailing out on a slower ax25 radio network.... So can you please
think before you include the quote of an entire packet-radio-digest,
Just to say YES I AGREE to some single one line topic !!
Thanks you DC0HK.ampr.org btitmars@esoc.bitnet [digest.mail.gate]

>
>Basically, collision detection is done by comparing the bytes being received
>with the bytes being transmitted, taking into account repeater delays. And

^^

Some details on how this will be done would be appreciated!

>the repeater runs the same code as the user station.

The figure showing the repeater configuration has the received data gated directly to the transmit data line. I presume this is an oversimplification to keep the diagram simple - or have you really found a way to do this without a FIFO buffer? I'm just about to lash up another FIFO circuit for our next 56kb/s repeater (actually, >56k is planned), and if it ain't necessary, I want to know! :-)

>The user station consists of a Hamtronics XV-4 transverter (29 MHz to 433 MHz)
>and an SHF electronics 900 MHz transverter, with just the receiver part

Barry, indeed a FIFO is needed. The diagram was simplified to emphasize what we are doing; we intend to borrow heavily on the work you guys have done!

The byte-by-byte comparison works like this: You start sending your bytes, and keep them in memory. You then keep comparing the byte you receive to the first byte you transmit. If no match, you wait till you get the next byte, etc. (note in the repeater's case, you get your echo almost immediately). After you've waited the FIFO length + prop delays + scrambler delays, and you haven't begun to sync to the received bytestream, then a collision must be happening, so you abort transmitting.

Incidentally, Barry, you seem to be using a pretty deep FIFO; is there any particular reason this can't be just a 2-byte or 3-byte FIFO?

The advantage, besides detecting collisions, is that we expect to send BIG packets without adversely affecting total channel throughput, because we know that the receiving station hears us, and we won't have to retransmit. The largest packet size can be dynamically determined by making the length inversely proportional to the number of stations using the repeater.

Best -Mike

>to know what others think, do you care if your messages are edited?

Personally I think that:

1. He who owns the hardware... owns the hardware and all that implies.

2. That probably too many sysops are overreacting to another overreaction
   that the FCC Field Office in Norfolk made concerning "business messages".

   a. That an overreaction from the sysops is understandable due to the
      FCC's lack of clear guidelines and nebulous and inconsistent
      enforcement policies concerning a LOT of the regulations.

3. That there is not a heck of a lot a ham can do in North Carolina
   concerning the activities of a sysop in Washington State.

   a. Thus, local problems have to be solved locally (if they can be at

all), and there is not too much others can do about it, other than make the sysop aware of their opinions.

In reply to greg@uts.amdahl.com (Greg Bullough) Jim writes:

>I didn't say the sysops had to let illegal traffic pass, just that they
>had no right to edit the traffic. They can certainly kill anything that's
>truely illegal.

There will always be a difference in opinion between two people in what is termed "illegal". If the whole message was to be deleted and a response sent to the sender as to why... there would be a hate mail battle started in a large percentage of cases as it is obvious that he who sent it felt it was legal to begin with, and as such... he is going to be upset that it was killed. Thus sending a message back to the originator will START more battles (IMHO) than "X"ing out parts of it and letting the rest go.

Possibly a better way to address this Jim, would be to get the FCC to come out and say that only the originator will be held responsible for a message on packet and not the BBS's. If they came out with that statement, I would agree with your points 100%, but since just the opposite is what happened, my support is with the people who have already been slammed once for trying to be an active part in packet development.

Greg writes:
>You are free to attach to your message "To SYSOPS: if you believe that
>this message cannot be forwarded in its entirety, please do not forward it
>at all, and

Jim replies:
>I should not have to attach this to every bulletin I send to keep sysops
>from hacking my messages.

Maybe not. But BBS ops should not really have to worry about being slammed for passing on a message either (again IMHO), but they have been, thus they reacted. So now we have a situation. Granted it's sad that it has come to this point... but the only thing you can do about it is have personal discussions with the people that you know to be doing it, but the bottom line is that it's their call.

Greg writes:
>However, I suspect that if we have a bunch of folks whining about
>"censorship" on one side, and the FCC on the other, a number of
>sysops are going to decide that the stress isn't worth it, and simply
>shut down their systems. Then what are you going to do? I suggest

Jim replies:
>If you want to pull the plug rather than work with the amateur community to
>do the "right" thing, then I suspect we'll all be better off.
>After all, it's no magic trick to put a packet BBS on the air.

^^

No... and it's no "magic trick" to put up 56 kbs backbones, or T-1 links for that matter... in fact not too much in Amateur Radio is a "magic trick". However it does take money, dedication, time, effort, and a certain attitude the combination of which is a pretty rare quality. I also note your statement about "working with the amateur community to do the right thing". I must point out that while I personally respect your views (and really do understand them) you do not represent "the amateur community" nor do your opinions necessarily represent "the right thing".

So while I support the fact that all Amateurs should work towards the common good by doing the "right thing", I think it is premature to make the innuendo that these sysops are not.

>I'm not asking for sysops to do anything they believe is illegal, only that
>they not edit user's messages without their knowledge. I took a packet poll
>of about 10 sysops here on the east coast last week. They were all nice

>edited messages. The other 9 all said that it was not their place or intent
>(nor did they have the time to read them all anyway) to edit messages. I
>suspect the FCC will need to make some adjustments in their policies as
>our fledgling network grows. In the meantime, let's do what makes sense.

If only one of out of 10 is editing the messages, then it's probably not too severe of a problem (if your poll is representative of the community that you were trying to poll). There is no doubt that the FCC needs to make some adjustments in their policies! In fact.. I personally believe that this should be our major thrust and not railing on sysops for reacting the way some of them did to a really stupid FCC interpretation and resultant action.

Those that are editing messages will in time relent from their activities if the FCC relents from the type of activity that led to it. Attacking the sysop is counter-productive, especially if done publicly. It has to be a local action, and if you can't come to terms, then it has to be a local GROUP action that agrees to not support his BBS. Anything else will just lead to a flame battle with common sense going out the window in favor of hate and retribution.

I've being looking round ftp sites, particularly in the US, for packet
software and have noticed that most of the versions of G8BPQ's node
software are very old (at least 8 months or more).

The current version of John's software is v4.04. Does anyone know of any
ftp sites which have the current version? If not, I can supply it (in ZIP
format) to anyone who's interested in a copy.

HI, I am trying to run the OS/2 version of NOS and it requires hardware flow
control. I've had my tnc's (a KAM nad a KPC-2) set up for hw flow for quite
some time and have been running them that way with the DOS version for about
a year and a half with no problems. BUt the OS/2 version doesn't work. I got
out my break-out box to see what for. I found that the tnc's (neither one)
actually pull CTS high in response to RTS from the computer. I guess DOS
doesn't care so that version just chugs right along. I've checked and double-
checked every flow contro parameter but still no luck. The manual says the tnc
will use RTS/CTS, but that doesn't seem to be the case. Has anyone else
experienced this? IS there a fix? I'd hate to have to junk 2 perfectly good
tnc's because of this. Any help would be appreciated. Thanks, Jay

But now they are exposed terminals to everyone within range and for
those users who *must* use them, either temporarily or permanently,
they represent a loss of thruput to that user and all others on
the frequency due to the classic exposed/hidden terminal problem.
Since you have to have them in the real world to maintain connectivity,
everybody loses.

>full duplex repeaters.

Phil, you can't pipeline the next packet until the *first* repeater
retransmits it, so you *do* halve the effective baudrate. It's true
that with careful power control you might not halve it *again* at
each hop, but the basic halving does occur. The only way around this
is for the repeater to retransmit on a *different* frequency. That's
what a duplex repeater does with the additional benefit of no store
and forward delay. At 56 kb halving the effective baudrate is not too
bad, but at 9600 and 1200, halving the baudrate is painful. It basically

makes interactive work impractical.

Is not the P persistence protocol an attempt at implicit CA? Especially
when used through a duplex repeater where there are no hidden terminals.

Sure, but the additional expense to *each* user of full duplex must
be traded against the chance of collision. Those duplexers cost like
blazes and cross band implies either a lack of capability to form
ad hoc simplex networks or implies doubling of basic radio cost to
allow simplex operation on each band. It's an ideal, but an expensive
one.

ok repeater fans, HELP !

There has already been considerable discussion on the merits
(perceived or otherwise) of using full duplex 'voice style'
repeaters for packet. In general, it seems fairly clear from an
intuitive sense, that the repeater concept reduces the 'late hit'
collisions that result from hidden transmitters, thereby negating
the need for critically organized local networks or cell-group
systems.

Collisions can and do still occur, however 'window of susceptibility' is reduced from infinite to a few hundred ms out of each 3 to 7 secs transmission. (at least at 1200 baud, with moderate frame limits). If you've ever worked a mountain top digi/netnode/simplex switch, common sense will tell you, while this may not be the most efficient to increase thru-put, there is at least some measure of improvement.

That being said. Here in Connecticut I operate a repeater on 146.415 / 147.415, intended primarily for packet. The machine is an older G.E. master-pro, using a wired 'ored' combination of the repeater receiver squelch output and the DCD output from a TNC1 to key the transmitter. (Actually the dcd contribution is totally redundant in this setup and as near as i can tell is not really necessary.) The hang-time for the machine is set for about 8 secs to accommodate 'reasonable' (empirically derived value, subject to opinion and/or religious beliefs) ack or next-frame times at 1200 baud. The machine passes regenerated 1200 tones, with no ability to stop or do any 'real time' evaluate any incoming frames.

The choice of the noise/squelch-detect transmitter control was based on minimizing the repeater key-up delay time, and the fact that i have yet to see a data carrier detection scheme that is as fool-proof. In addition, higher baud rates are eventually anticipated making the squelch circuit the reliable common trigger for multi-baud operation.

Most of the activity on this machine centers around Karn's tcp/ip application, and the machine is cross-band linked (via NOS) to several other machines in the area.

Here is my problem:

Most users of 'voice style' repeaters for packet, have no doubt been using the "ol' reliable" TAPR command set parameters for TXD, AXD, and AXHANG to minimumize unnecessarily long TXD settings. Has anyone implemented the use of these parameters for KISS mode?? While some may argue that sacrificing one packet at the beginning of each transaction is not substantial, (altho at 1200 baud it seems pretty significant!!) missing one frame may cause nos/net application to drop to the first level of backoff and if for some reason a long irtt value has been stored, the connection may *never* ('never' on an interactive level appears to be about 90 secs in my area) be established.

I realize complicating the KISS implementation may well be the proverbial 'can-o-worms', but this seems fairly consistent with the KISS tnc philosophy.

Comments? or solutions?

Why do us hams persistently refer to contacts as 'simplex' as opposed to
'half duplex'? We are *WRONG* to do this.
The internationally accepted definitions (as used by IEEE, CCITT, ISO etc)
are quite definite. A 'Simplex' circuit works in one direction only!
You are engaged in a Simplex contact when listening to WWV.
When you are working through a normal voice repeater or a normal digipeater
or working someone on SSB voice, then you are having a 'half duplex' contact
because it only makes sense if one end transmits at once.
You need some protocol to manage the link to stop both parties deciding to
key up at the same time.
Full-duplex implies that both ends can transmit concurrently with no mutual
interference or interaction, like a telephone.
What is being described as a 'full duplex digital repeater' is being
mis-described. What it really is, is a half-duplex repeater with collision
management to make it work.

In response to N2LAW's problems with an overly sensitive Yaesu FT-470 dual band HT, so bad that he couldn't receive packet ... there is a known problem with the FT-470 front end (really just the 2m portion) where (apparently) the choice of IF frequencies allow all kinds of intermod to take place.

Yaesu knows about this problem and they will fix your radio for free (call Yaesu for details). However, others have told me that Yaesu has already made those mods on the newer HTs, and that Yaesu will use the serial numbers to check to see which group you're in.

I haven't had the mods done to my FT-470, but I regularly talk to another guy who has. His opinion is that the sensitivity as been decreased slightly, some of the intermods have gone away, but he's still plagued by other intermods as he drives into the city (WashDC).

Nope, it is full-duplex because the repeater transmits and receives at the same time on it's given 'channel'. The half-duplex confusion comes in because the end-users equipment usually can't listen while it's transmitting. But that is a problem at the end-user equipment, not at the repeater. If you as an end-user had enough isolation between your receiver and transmitter (and they could operate independently) then you would be using the digital repeater in full-duplex mode. This is not unheard of and no longer uncommon.

The definition of full-duplex makes no requirement that the transmitted and received packets at one end of the link are different. Just because that happens in the SIMPLEST case of a digital repeater makes no difference. In the more general case, how do you define the duplex mode of a repeater that is multiplexed on different channels? Consider the following example that most everyone should be familiar with. You have a repeater system with a phone patch on it. You as an end-user have a simple radio and bring up the phone patch. You dial a number and start conversing. Suppose the person you've dialed to starts speaking at the same time? As far as you're concerned you're operating in a half-duplex mode. But anyone else who can listen on both the transmit and receive freqs of the repeater understands this as full-duplex operation. The repeater and the medium (in this case a split channel) is

There are lots of other reasons that have nothing to do with radio cost --
I run NOS to a TNC basically running in KISS mode. Occasionally, I have to
take that computer off the air to do other work. I am close to dedicating
a computer, but most of them cost more than a radio. I think it's a bad
assumption that enough stations will stay on the air except in the most
densely populated areas -- even then it may not be correct.

>But even if you have users going on and off the air, the network is
>designed to adapt.
...
> Only if it is impossible to find another path will the network be
>partitioned.

There are many cases where you just can't get from there to here, even
if you want to pump up 1500W {like to see that in a cheap data radio 8-)}.
What you'll end up with is exactly what you allude to later in the
quoted posting -- several 'reliable' nodes, probably with good area
coverage, serving for most traffic. Let's design for that. After all,

the cellular phone system wasn't/isn't designed so that your car phone
acts as a cell relay.

>>As far as halving thruput with each hop, a system that begins with a
>>very high speed can afford to do that.
>No, throughput will NOT DECREASE with additional hops! Because power
>control keeps you from blanketing the entire network with your
>transmissions, you can "pipeline" your packets down a chain of simplex
>repeaters. Once one of your packets has propagated out of (relatively
>short) range, you can launch another before the first one has reached

Power control or no power control, your throughout WILL decrease
because you have to run real-world protocols -- TCP/IP does end to
end acknowledgements, but most AX25 won't let more than 7 packets at a
time be "on the fly". And applications (and users) tend to send
about a packet's worth of data before waiting for the other end. Your
pipeline will (almost) never be filled. Even all this assumes no
packet loss -- every transmission is at risk. I think I could show
that in most environments, a full-duplex repeater would win in throughput
over your chained siplex repeaters.

>its destination without interfering with it. And since the average
>transmit power will decrease with an increasing density of nodes, the
>overall network capacity automatically INCREASES as you put more nodes
>on the channel. Try doing that with either conventional digipeaters or
>full duplex repeaters.

Try figuring your probability of collision if you have a dense grid
of simplex repeaters. Granted it may be better to use some smaller
number of reliable sites than one big repeater, but "every node is a
variable power simplex repeater" doesn't seem to be an automatic
winner.

Cheers,
 Willis n5szf

PS Anybody out there familiar w/ a network simulation package called
LANSF? I'm trying to use it to model some of the packet LAN
architectures, and I could use someone to bounce ideas off of.

The information above is CORRECT! In certain parts of New York,
the 540 numbers are billed like 900 numbers, and in fact,
preceeded the 900 service. What's worse is that 540 is not the
only prefix being used this way. Sorry, but I can't remember the
others (there are at least two) that also use the automatic
billing and there have been several reports of them turning up on
pagers as well. If you get a page from the 212 area code that is
not a number you are familar with, be aware that you might be in
for a large bill if you call it. This scam is being investigated
by New York authorities according to the story I saw here.

Wish it were so, but a very recent (last two weeks) news story
here says they are still operating and using numbers with at least
three different prefixes. It also indicated that it is more than
one srevice doing this. (But then, newspapers have been wrong
before :-)

Has anyone used this code? I just made EPROMs of 1.1.7 and 1.1.7b and tried
them in a PACCOMM TNC-200 (a claimed true TNC-2 Clone.) Neither of them do
anything at all. Is there something I am missing here?? Is there more involved
than just making and installing the EPROM?? It originally had 1.1.3 in and that
still works. I want 1.1.7b because of the supposed, improved KISS mode. I have
been using a KISS only EPROM, but it is a rather old version and I am having
some problems with it now.
Can anyone offer any insight into what it takes to make 1.1.7b actually work??

Thanks in advance.

|> Why do us hams persistently refer to contacts as 'simplex' as opposed to
|> 'half duplex'? We are *WRONG* to do this.

For the same reason as why people say they have a 2400 baud modem at home.
There are many other inaccuracies in (at least) the American dialect of
English. It may be technically wrong, but the concept is right. Or, at least
the concept is understood in the framework of the person's understanding.

There was a story where a tourist was lost and asked a distinguished-looking
man, "Excuse me, but do you speak English?" The man replied, "Certainly.
And I understand American."

What can I say?

In an article some unidentified person exclaims:

> Why do us hams persistently refer to contacts as 'simplex' as opposed to
> 'half duplex'? We are *WRONG* to do this.

My opinion is that people have a tedency to start arguing about words
and semantics when they do not understand the topic originally under
discussion. Sometimes people use the wrong words to refer to something
in such a manner to confuse the issue; when this happens it makes sense
to get in sync on the lingo. However, when the meaning is clear, or
the words are correct in the context of the discussion, nit-picking
over actual words is counter-productive.

Subject : Re: Censorship of packet bulletins

Brian Kantor (Brian@ucsd.edu) responds:
>If you post a message to a ham packet radio BBS and a subsequent
>forwarding BBS operator alters that message without your permission
>and redistributes it, he has quite possibly violated your inherent

>copyright on that message. Sue him.

I was not aware that you were also a lawyer Brian. However I think
that your advice is a inappropriate, over-reactive, and counterproductive
approach to a problem, and demonstrates exactly why I told Jim that it
might be inadvisable to notify the originator of any message that it had
been killed and for what reason. While you personally may agree that a
SYSOP has the right not to forward, another may not... and if he shares
your views on how to handle something that he personally happens not to
agree with, then the sysop is asking to be sued. Isn't ham radio great?
Just think... a hobby that can lead to a person being sued... yeah, that's
the ticket!

>I believe that a sysop has the right not to forward a message, but has
>NO right to alter its contents.

It is interesting to know that this is your opinion. It is my opinion
that a ham has the right to take any action that he feels necessary to
protect the privileges of his Amateur operating license. If another
ham disagrees with his method(s) then it would seem that a friendly
discussion might be a rational approach.

>Are that that desperate for BBSs that we'll put up with this kind of
>nonsense?

Simple solutions Brian:

1. Personally fund and replace any BBS/Node/whatever that operates in a
    fashion that does not agree with your viewpoints.

2. Do not use BBS/Nodes/whatever that operate in a fashion not meeting
   your approval.

3. Threaten to sue fellow hams for not agreeing with your viewpoints.

A story comes to mind. A person is standing on a bridge admiring a
beautiful river. Suddenly he looks down and notices that a dog is
relieving himself into said river. Is it rational then for the
observer to conclude that the whole river is polluted and thus
distasteful?

Consider that when you are ready to sue a man who has made a pretty
big commitment towards the betterment of packet radio, just because
you don't happen to agree with one of his methods.

To be specific: I would not maintain that a BBS system operator must
carry my traffic. It is his equipment, and his station, and he can run
as he likes. That is his right. I think it would be courteous of him
to inform people whether he is exercising (exorcising??) that option,
and to allow messages to route around him, however, that's a degree of
fair-mindedness that I don't really expect many sysops to maintain.

But a message I have written is MINE, not his, and he may not make any
alteration to it without my permission. That is not only common courtesy,
but it is (as I understand it) USA and international law.

To be more general, I am more and more convinced that the FCC's
regulation of the content of transmissions by amateur radio stations
is inappropriate and should be removed. Legislation to this purpose
(or if necessary, action through the courts) needs to happen.

But as I see it, we, as hams, have a better track record of giving in
to the whims of government bureaucrats than nearly any other hobby or
profession I've ever been associated with.

My use of hyperbole, overstatement, and taking of extreme positions is
in reaction to the incredible number of "don't argue with them, they'll

just screw all of us" attitudes I see on the net and hear on the air.

If this controversy stirs a few more hotheads to get involved in making amateur radio better, we will ALL benefit.

Remember, it's a sheep's destiny to be butchered. The question to ask yourself is whether, at the end of your life, you'll be able to look back and say that the world became just a little bit better because you had lived in it.
- Brian

>happening, so you abort transmitting.

>Incidentally, Barry, you seem to be using a pretty deep FIFO; is there any
>particular reason this can't be just a 2-byte or 3-byte FIFO?

Probably not, although I wouldn't want to stake my life on it. The choice of a 32-bit FIFO was based upon a back-of-the-envelope calculation (I no longer have the envelope :-)). It assumed that the cheapie 3.579 MHz crystals used in the DSY modem's baud rate generator could have a fair amount of variance in nominal value, plus the fact that we might want to experiment with humungous packet lengths or digital voice. Since the FIFO starts off half-full, the actual delay is 16 bits, or about 0.29 ms. In terms of

overall delay, this isn't much compared to the preamble of 12 ms or so which is needed for the scramblers plus DCD/clock recovery.

What you could do if you wanted to use a very short FIFO is install a trimmer in the 3.579 MHz oscillator. Then everyone could "net" their modems to the one at the repeater by looping back through the repeater and tweaking the trimmer until the rx and tx clocks were in phase.

I hope you'll be able to collect some 'before and after' stats - it would be great to have some real world results on the merits of CSMA/CD versus standard CSMA.

Just to say (not that it matters) that I personally agree with you wholeheartedly Brian. However I think that I might have a higher opinion and regard for sysops in general.

>But a message I have written is MINE, not his, and he may not make any
>alteration to it without my permission. That is not only common courtesy,
>but it is (as I understand it) USA and international law.

Ummm. I don't know. First of all "XXX'ing" out something is not QUITE the same as going in and reWORDING a message. The subject line of this string is "Censorship" and it may be a very fine line, but to Censure is not quite the same as to "ALTER". I fully agree that no one should ALTER, a message. If someone added some words, or in fact added whole paragraphs, then I would

be quite angry and would agree with your whole point of view.

When someone REFUSES TO FORWARD your whole message, he is CENSORING your WHOLE message! When someone goes in and "XXX"'s out say a phone number like: 1-900-332-2491, then he is censoring a PART of your message. If he went in and CHANGED the phone number to "1-215-688-0997" then he is ALTERING a message. So your real bottom line is that you are saying that it is OK to censure ALL of your message, but please do not censure PART of it. Ok... fine.

Given that the simple inclusion of a "900" area code number in a packet bulletin led to a whole string of BBS's being cited by the FCC, then I can see the point of view of some sysop that did not WANT to trash a whole message from ANYONE, but sure as heck could not let it continue with that phone number in it! That (at least now) is a clear cut precaution, although it fries my shorts that simply telling people to call a 900 number is considered "business". I suppose that if I were to tell you Brian that the part you needed to fix your radio was available from RF PARTS and then gave the phone number for them and suggested you give them a call... that would also be conducting business. This whole issue stinks! (Not you, the FCC's interpretation of this issue.)

In all honestly... I sincerely believe that if you tell a sysop that you would rather he trash a whole message other than XXX'ing out anything at all, that more than likely he will gladly comply. It's easier.

>To be more general, I am more and more convinced that the FCC's
>regulation of the content of transmissions by amateur radio stations
>is inappropriate and should be removed. Legislation to this purpose
>(or if necessary, action through the courts) needs to happen.

Brian... that sounds good on paper. It sounds good in public. But it does not sound good when implemented in a group that includes a certain fringe faction that takes great pleasure out of abusing any and all personal freedoms allowed to them. Given Carte Blanche on subject matter, you can be dead certain that THEIR freedom would very soon interfere with MY freedoms. What is considered as "acceptable" PUBLIC subject matter at any given time is something decided by society at large. I agree that it is probably impossible for the FCC to keep up with this... but to ascribe to the alternative.. no regulation at all, is to invite abuse that is NOT approved by society as a whole or even a majority.

And please don't give me the answer of: "If you don't like it you can always turn the dial". WRONG! When I have to turn the dial once in a rare while... I can live with that. However when I have to keep turning and turning and turning that dial... I will NOT put up with that, and most especially so when the majority agrees. Lack of any regulation, means lack of ANY control. Lack of ANY control is usually described as chaos. I think your idea is great, but I do not believe that the world is yet perfect enough that it should be implemented.

>But as I see it, we, as hams, have a better track record of giving in
>to the whims of government bureaucrats than nearly any other hobby or

>profession I've ever been associated with.

That is (IMHO) mainly because a lot of people see this hobby as a
privilege and not as a Constitutional Right, and as such we can lobby
for changes in regulations, but we still are bound to abide by them.

If your meaning is that we don't lobby effectively enough for better
(more in line with reality) regulations... then I agree... totally.

And more specifically... fight for uniformity, common sense, and
cooperation in the ENFORCEMENT of the regulations that we already
have, instead of the sporadic, catch as catch can, "depends on who
you know", type of action that presently seems to be the case when
dealing with the bureaucracy called the "FCC".

>My use of hyperbole, overstatement, and taking of extreme positions is
>in reaction to the incredible number of "don't argue with them, they'll
>just screw all of us" attitudes I see on the net and hear on the air.

Ok... but I don't think that it is necessary. I would rather listen to
your calm side. You make a lot of sense when you seriously discuss things...

>If this controversy stirs a few more hotheads to get involved in making
>amateur radio better, we will ALL benefit.

Hotheads very rarely benefit anyone... including themselves.

>Remember, it's a sheep's destiny to be butchered. The question to ask
>yourself is whether, at the end of your life, you'll be able to look
>back and say that the world became just a little bit better because you
>had lived in it.

A man that digs a ditch to the best of his abilities, is honest/friendly,
and helps his neighbors is the type of guy that in my mind makes the world
a better place. He might never think so, but all those around him do.

>(No, Mark, I'm not a lawyer (yet). Perhaps when I have more time, I'll
>take that degree too. It is something I've often considered.)

I've seen it and found that things behave much better if there is mail in the /spool/mail (or whatever) directory. Without mail present I haven't yet figured out how to make it run. However, this is only after trying for about 15 minutes one evening. Maybe someone else knows the secret of making it function when there is no mail waiting..

>Is not the P persistence protocol an attempt at implicit CA? Especially
>when used through a duplex repeater where there are no hidden terminals.

Not really. There doesn't seem to be a widely accepted definition of
what "collision avoidance" implies except for Apple's use of that term
to describe their Localtalk protocol. So I would tend to limit it to
describe protocols that involve some sort of handshake (explicit or
implicit) between sender and receiver in which the receiver's side of
the handshake tells other stations to stay off the channel for a
while. p-persistence does improve CSMA, but it doesn't add the
receiver-directed collision avoidance feature.

I just hazard a guess that the manufacturer's find it easier and cheaper
to buy a 12 volt power supply where the transformer hangs off the wall
receptacle than to build an AC supply into the box. Although power
supplies appear simple, there are a lot of details relating to safety,
UL and other approvals.

Personally I dislike having an assortment of bricks and blocks hanging
on my outlets. Especially the ones which are big enough to cover the
adjacent receptacle, and have a three prong plug so you can't just turn
them around! arrgh! :-(

This query origionated from VK5GU, but it got me thinking ....

Is there any software in existance that provides Baycom/PMP facilities on
the mac ?? I realise that the mac serial port may not lend itself to this
sort of software as well as the pc ......

Also, has ayone played with running the above pc packages on a mac using
SoftPC ??

Im am totally unfamiliar with the requirements that the Baycom and PMP modems
have ion respect of EIA controls on the serial interface, and can only assume
that the RS-422 on the mac may pose problems when looking for power/controls.

Any comments _MOST_ welcome !!

I recently got an MS-400 card that had been modified to operate COMs 3-6 with IRQ 2. It had been used in a packet BBS setup with WA7MBL amd later W0RLI software. I did not receive any docs with the card (used card) but wish to change it to standard COM 1-4 IRQ 4,3 for COM 1 and 2 and IRQ 2 for Com 3 and 4. Is there any out there who can supply the info?

Aside from its reluctance to do anything if there is no mail file to read, I've noticed a couple of other anomalies with PCElm 3.0:

The program seems to want to create its temporary files in the current directory rather than in the directory pointed to by the HOME environmental variable. Unfortunately, it has a problem when run from the root - when you try and send mail, the program aborts with a message to the effect that it can't create "C:\\mailtext".

PCElm 3.0 also seems to have a problem handling multiple recipients in the alias file. It processes each entry (but I wish it could handle lines longer than 127 characters!) but fails to increment the message number, so each new message overwrites the previous one, and only the last recipient on the list actually gets the mail.

These problems aside, I like the program, and I hope the authors continue to support it.

Don't think so. This whole idea works because it is EXPECTED that the
only guy on the Repeater's output is the repeater! Consequently anyone
using the repeater will only hear the repeater.

>Packet frequency usage
>and siting would have to coordinated a whole lot more than it is now to
>completely eliminate the possibility.

Yep, coordination is absolutely mandatory...but the statement that
we would be doing it a whole lot more than we already are doesn't
seem to hold up...just ask AA4RE.... Roy serves as the Packet
Freq coordinator for Northern CA. NCPA(Northern Cal Packet Assoc)
has been doing coordination for a few years now, and seems to be
doing a very solid job of it.

> of a data machine are much different than voice).

This is what happened in this area. At first the coordinators had trouble with it being packet on repeater frequencies. Now the situation seems more reasonable with the distinction being simplex vs repeater pair coordination. The requirements of a data machine can actually be less if you assume that only fixed stations with beams are accessing it. Re-use of the pair should be easier than with high power omni-mobiles roaming around as with voice repeaters.

> Would a data machine and

> of voice machines around)

I don't see any real problem with coexistence. Even though there is an overabundance of voice machines the spectrum in most areas is allocated. Taking away allocation is a very touchy subject if it is your allocation that is taken.

(Example, supposedly there is someone in Boston with three UHF allocations. three repeaters linked together at someone's house. silly but thats the way it is.)

> left the TNC.

This is only part of the reason for txdelay - it also compensates for the other guys T/R switching. TXDelay rather elegantly takes care of these. How do you know if it works? Simple - you set it empirically, so it works with all the stations you want to work - and you'll hear about it in rather short order if it is set too short :-)

Another drawback - most hams have a PbSn (that's solder to you non-chemistry-types :-) phobia, and you'd never get most of 'em to solder in the extra wire. Look at the federal project we have with the 2 stinkin' wires needed for 9600 FSK! Yes - folks would rather BUILD an expensive and inefficient fax-chip based modem than solder 2 wires into their sacred 2 meter rig.

> What is the idea for the optimum solution? What I would like to

> only the good stuff), with telnet connections, and some FTP, and some
> SMTP, this an X session thrown in for keeping things busy.

I'd much rather see 9600 on 2 meters. Why? It's top speed there, and needs only 12 KHz - actually a little LESS than wasteful 1200 baud!

I can see some wanting 9600 on 222 (I HATE calling it that!) or 440, as a second 9600 port for home, but in general, I feel we should use the higher bands for higher speeds.

> Yes anything at or above 9600 should be full duplex (actually the 1200
> should be also, but who's gonna listen?) This leads to weird repeater
> situations, and might be real hard to keep organized.

I'd much rather see duplex repeaters (not full duplex). We have 2 duplex packet repeaters here in L.A. (one 1200/9600 dual speed), and they work extremely well.

Full duplex would require crossbanding, a definite turn-off for all but the most rabid amongst us.

> Probably better solutions would be spread spectrum, or 'cellular'

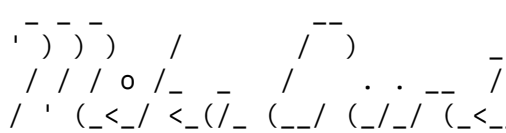
Work these options out and let us know your results.

-o-

Don't take this as a negative lecture - it's not intended as such.

A fan of Ernest Hemingway approached him with a "great idea for a novel". After listening to it, Hemingway asked "well, how does it begin? What are the characters like? What about the setting? How will the plot develop?", and a lot more questions. The fan said, "well - I don't know...". Hemingway then pointed out that it was a LONG way from being a great novel.

Same way with other ideas. There are gadzillions of 'em - but most never progress past the "idea" stage. Why? Just like the fan, we all assume that someone ELSE will develop our idea.



There are several very wealthy companies who will develop other peoples' ideas - for a fee!

I don't mean this to be a lecture, or anything at all negative; rather an encouragement to _research_ and _develop_ your ideas yourself. After all, it would be a shame if you had the answer to all of packet's problems, but it never got developed because you left it up to others.

As Edison once said, "Genius is 2% inspiration and 98% perspiration".

I suppose that's why some need deodorant more than others :-)

yup - except it doesn't work (at least on version 3.00). Some
stations are eliminated when using software CD. I'm back to using my
old faithful DCD state machine.

> German TNC2 clones by DK9SJ have an Exar 2211 DCD circuit. It works rather
> well but it cannot distinguish audio bleeps from real data.

The MFJ line uses EXAR 2211's, too - and seem to be the best 1200
modems around. In addition, the 1278 has a true DCD state machine,
and works the best of any 1200 TNC I've ever seen!

> We have modified all our network TNCs to have the state machine and try to
> encourage all users to make the modification, too.

Good move! I too am convinced that ALL networks (AND all end users!)
would be well advised to use true DCD. It doesn't just minimize
TXDelay - it actually improves _Y_O_U_R_ throughput! How? Simple:
less collisions, less txdelay (ergo more time for data), less problems
with others using short TXDelays, less chance of being collided with
(because you listen that much closer to your keyup!), and a couple
giggly-zillion other reasons. I think it's the best $17 that can be
spent on 1200 baud packet.

 Yours,

To quote Paul Newman, What we have here is a failure to communicate.

It seems Bill is talking about DIGIpeater, and Dana is talking
REpeater. Apples and orangutans.

A duplex packet repeater is functionally a "bent pipe" that
retransmits IMMEDIATELY what it hears, and REQUIRES a PAIR of
frequencies. When one speaks into a bent pipe, he hears his voice
come out of the other end immediately. It is not stored and
forwarded.

We have 2 duplex packet repeaters in Los Angeles. Collisions are
exceedingly rare on a voice-type repeater (a "bent pipe") with a
modem for regeneration of packets. Actually, our 1200/9600 repeater
uses the data slicer from a k9ng modem to simply "clean up" the 9600
data.

This is NOT the same as everyone having transmit and receive running
100% - We don't run full duplex; the REPEATER does.

It's just like your local VOICE repeater, which is technically a
"duplex" repeater, i.e. IT uses 2 freq's at once - but the USERS only
have to change frequency upon transmit (or receive - however you
prefer perceiving it :-)

and this _is_ "as easy as pressing the repeater split button on your
radio".

This has often proven to be a difficult point to get across.

Why do we call them "duplex repeaters"? Simple - because with packet,
we have "simplex repeaters" - digipeaters, ka-nodes, netwrong/TheNET,
ROSE, ad nauseum.

> >I may transmit on a different frequency than I receive on, but

I have synthesized rigs that work down to TXD 3 (30 mS), i.e. Icom
290H, etc. I have never been able to get any rig working at less than
3 with the local stations I use for testing.

On 2 meter 1200, I find TXD 50 to be necessary. Some stations need it.
These, of course, are not running DCD state machines.

Also, not all rockbound rigs are that fast, due to poor design
relating to T/R switchover and receiver recovery. This is not an
important design criteria for voice rigs.

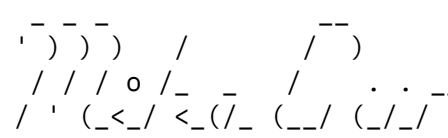
I think you're missing Phil's point, Gary - these aren't "sites" -
they're end user stations. Instead of having dumb, wasteful digi's,
or netwrong that doesn't work much better, they're RF-power controlled
"smart" store and forward - probably at speeds more like T-1 than
1200. They minimize QRM by keeping power to what is actually legally
required; the minimum to communicate.

Who pays for them? Anyone who wants to be part of this particular
high speed system. Depending on how you view it, it's either
"democracy" or "anarchy" :-)



As far as halving thruput with each hop, a system that begins with a
very high speed can afford to do that.

If the unwashed masses want to use boring 1200, they're still welcome
to do so, and a bent pipe duplex repeater will work miracles for them.
We have 2 of these varmints in L.A. (one is dual 1200/9600), and yes,
they work marvelously well - MUCH better than a pair of simplex
channels, especially when things get busy.

Nonetheless, there's room for both - and more - in amateur packet.

(Besides, I have a feeling you guys know you are talking apples and
orangutans :-)

Yours,

Howdy:

I am returning to life after a long hibernation (not self imposed).
From last October until last May, I was throughly occupied in a
professional capacity, nearly 24 hours a day with `world events.' I make
no apology AT ALL for doing my job, I am proud to have done this work.
Eight weeks ago, I was again sent away from home in a professional
capacity. Over the last four weeks of this trek, I spent a total of
SIX HOURS at home, since I had scouting commitments (I am assistant
scoutmaster for my son's troop, we had two trips) and AMSAT meeting
commitments (more later). There is little I could do about ham radio during
this time other than to take my laptop and do some software work in my `spare
time', what little there was of it.

I have news on several fronts: DSP, DOVE, Phase III-D.

DSP: At long last, the AEA box is right as rain. I cannot tell you how

painful this has been personally. Over a year ago, Brooks Van Pelt, KB2CST, went off on his own, with all he learned from Pat (KA2MOV) and I, while funded by AEA and started the DSP-12 (the LL Grace box). I kept telling AEA that we had to hold off until the hardware was right. They kept insisting that I fix the software first. I could never seem to get it through their thick heads that the egg comes before the chicken. What they wanted to do was to sell the hardware, as is, with the best job I could do with the software. I refused. The result of this was that Brooks was able to finally get to the point WHERE THE AEA BOX WAS ONE YEAR AGO, and he started marketing the box. Unless something has recently changed, the DSP-12 is NOT LEGAL FOR SALE OR OWNERSHIP IN THE UNITED STATES. This is because as of the last time I investigated (three weeks ago) it had NOT been through the FCC Certification process.

When Brooks started shipping his box about 3 months ago, AEA absolutely panicked. They went absolutely nonlinear. Brooks is a small operation, and unless he licenses the technology to another firm, which I would resist mightily, he is a pimple on the butt of the world. He cannot do more than 10 a month production for the amateur market. I have done all in my power to resist the move by AEA to force Brook's former partners from suing him. In my opinion, Pat and I, and AEA have nothing to gain by giving him a David versus Goliath martyrdom to live under. It is clear to me that he has no assets that I could collect to pay attorney's fees and AEA insists that Pat and I eat those costs. FORGET IT. I believe Brooks is teetering on the brink of financial disaster and I for one just want to leave him alone and let him sink under the weight of the pile he has made for himself. On a positive note, after refusing to move forward at all until the analog front end of this box was made right, we have succeeded due to a brilliant piece of retrofit engineering by Al Chandler, K6RFK, the VP Engineering at AEA. It is a great piece of work and fixes all the problems I have encountered. I RECEIVED THIS FIX LAST SUNDAY, thus the reason we have gone substantially nowhere in months. The problems were all due to the AGC implementation that Pat, Brooks, and I chose for the AEA DSP box and it caused poor performance in places that I refused to tolerate. Brooks has chosen to give up on those modes where this is a problem. I refused. The box, as originally designed, and essentially copied by Brooks for the DSP-12 in the DSP section, did an absolutely horrible job on Morse, AMTOR, APT-WEFAX, and other amplitude modulated modes, including some slow QAM stuff I have been working on for HF work. I have now done an implementation of EVERY MODEM PROMISED TO AEA IN THE BEGINNING, and all that remains is a bit of tweaking, and adding of frills that makes the things easier to use. N0JCF, W3IWI, KA2MOV, N6IA, K6RFK, and myself will all be testing these things as they get tweaked starting next week. It's a short timer at long long last and I will think long and hard about tackling such a project again as a basement wizard.

DOVE: As I've already mentioned, I got sent away from home several weeks ago for the job. Unfortunately, as far as doing DOVE's initial code load, I AM IT. It requires a special procedure, using S band equipment, which I will describe in detail in an upcoming article, and this procedure takes longer than two days, and that is MUCH longer than the six hours at a whack I have had to do the job in the past few weeks. Harold Price, NK6K, has done a great job on getting the software ready for his end, I have all the voice software running and tested at home, I have several voice files ready to load,

I just need time at home to use the station to load the bird. I hope that can be done next week.

One more interruption, albeit a pleasant one, occurred last weekend. Several AMSAT engineers and other volunteers met in Orlando, Fla (no sight seeing was accomplished, we worked the entire time even down to the attitude adjustment times, on Phase III-D). As many of you know, we are starting a new major satellite project in AMSAT, to be launched on an Ariane 5. We are one of the payloads selected for the test launches of the new Ariane 5, being developed now. This was made official last July. So good is our reputation with ESA and Ariane, our bird is THE load bearing structure for ALL the other payloads in our particular launch (CLUSTER is the ensemble of other payloads). Our bird is a massive brute. In its current configuration it is 500-600 Kg and 3+ meters in diameter with extendable solar panels that make it 10+ meters cross make this by far the most ambitious satellite project. In the openly expressed opinion of many participants in these engineering meetings, it is one of the most ambitious volunteer technical EVER attempted. It is exciting to be a part of it. Launch is scheduled for 1995 though many of us believe it will slip to 1986 at the earliest. We need this bird for sure since AO-13 has been the recipient of some unusually chaotic dynamics in it nonlinear dynamical system. It will reenter the earth's atmosphere and burn up in 1986 due to a completely unknown to us perturbation produced by the unfortunate choice by us for inclination and the RAAN given to us by the launcher and effects of their relationship to the orbit of the moon and forces from the sun's gravity. Tom Clark, W3IWI, at Goddard Space Flight Center has worked with colleagues there on a study he commissioned and has found just how both lucky and unlucky we are. AMSAT engineers from Finland, Germany, and the US were in attendance. If you include UOSAT amateur radio payloads (even if you don't but I just wanted to include them) we are by far the most frequent flyer on Ariane, and more to come.

That is enough for now, I will hope to see many of you in Los Angeles at the La Cienega Holiday Inn for the AMSAT annual meeting. There will be a FULL SCALE mockup of Phase IIID there for your amusement.

Bob

>
>Collision detection is an *analog* process, done at the physical layer. So
>for a system with CD, you not only need full duplex equipment, but you need
>some CD circuitry. How complex is this circuitry?
No, collision detect, due to the delays, will have to be a *digital*
process. I expect the packet to start sending and if a similar packet doesn't
show up on the repeater output in set (parameterized) time I will unkey.
The protocol may have to be changed to allow for a `destroyable' header
due to doubling. I do NOT expect any problems even handling 56KBaud since
the TNC could be sped up by using a Z80H or whatever if necessary.

>My point is that doing collision detection on a full duplex repeater/full
>duplex user system is complex and costly. It doesn't sound worth the effort.
Afraid to write software? and you are on a computer network? Wow ... The
complexity `may' come in on making full duplex radios, but I am sure that
a Full Duplex KISS TNC can handle the vulgarities of collision detection.

>If you aren't in the coverage, you're supposed to be on another LAN.

Are you not being a bit optimistic? In our considerably more sparcely
populated area (about a million people) we could NEVER force this. The area
that the population covers is `just' a bit larger than an acceptable footprint
for a regenerative repeater. There WILL be weak stations that `may' trip the
repeater `some' of the times that will be strong enough to break up other
packets (A hidden transmitter problem) by taking the signal out of full
quieting into the repeater.

If the system were CSMA/CD this wouldn't happen tho' ... :-} cause the errant
system will be wise to it's ways :-).

>Any comments??

Ok, I'll tell you how we do it in hardware. We take the output of the
receive modem and pass it through a multiplexer chip to the transmit
modem. The other side of the multiplexer goes to the TNC's SIO so the
backbone link, handled by one of our switches, can access the LAN.
We OR the CTSA of the SIO with the CD line of the receive modem to
generate PTT. So either an incoming packet or the trunk switch can key
the repeater, and the proper data stream is switched to the transmit
modem by a selector derived from either CD or CTSA feeding the multiplexer
chip. Two gates and a multiplexer do it all and they plug onto the modem
disconnect header of the TNC. Neat and simple. No software changes
required. We run ordinary KISS in the TNC. The switch sees every
packet on the LAN, but only acts on those addressed to it. Note
that you don't use a via to connect to somebody else on the LAN,
but you do use a via to connect to somebody outside the LAN by
multiport digipeating. You can also connect to the switch and use
it's NETROM emulator to get out of the LAN, and, of course, TCP/IP
works correctly. We run a local version of Phil's NOS code on the
switches.

For a standalone repeater, all you need is to wire CD to PTT and
loop data from the receive modem to the transmit modem.

>and siting would have to coordinated a whole lot more than it is now to
>completely eliminate the possibility.

At least in the SERA's area of authority, duplex repeaters are duplex
repeaters whether they carry packet data or voice. The same coordination
process applies to both, and both use the same set of repeater channels.
Therefore problems of interference are exactly the same for voice and
data repeaters. SERA does a great job and most repeaters never experience
co-channel interference unless there is a grandaddy of a band opening.
Operating simplex on a repeater input is bad amateur practice and we
will T-hunt you down and file a complaint with the FCC.

>On a side issue, can anyone tell me if the Ramsey 2m kits can readily be
>set up for duplex operation?

No. There isn't enough shielding between transmitter and receiver, in fact,
there is none. To operate duplex you need repeater grade radio equipment
like Motorola or GE that offer superb isolation between transmitter and
receiver. On the other hand, the Ramsey is a superb data radio for use
to *access* a duplex repeater, I'm using one now in place of tying up a
IC-28H. They switch fast and have adequate power and sensitivity to be
used with a repeater.

We do it the old fashioned way with packet radio clubs supporting the
packet equivalent of repeaters just like old line clubs support voice
repeaters. Packet is no longer the province of the lone wolf. To do
any worthwhile networking requires organizations that can coordinate
and finance packet trunks and LAN services. Here in Georgia the
LANs are organized as local clubs who are members of the statewide
networking organization Grapes. Note that Grapes is not a membership
organization, it's members are the local clubs that make up the
LANs. It acts as a coordinating and implementing body for statewide
networking activity. All network switches are owned and financed by
Grapes while LAN services are the responsibility of the local clubs.

It's been done. Our repeater coordinating body, the SERA, doesn't care
whether a repeater is to be used for voice or data. They just mark it
in their records as voice, data, or mixed. The only issue that concerns
them is co-channel interference. As long as the machine meets the
inferference contours, they'll coordinate it. They use a computer system
similar to the one the FCC uses for broadcast coordination.

As somebody else noted, the best radio for low speed packet is a single
channel crystal controlled rig with fast TR switching and open squelch.
Words to live by, STAY ON YOUR LAN FREQUENCY. Don't go hopping all over
the bands or you'll confuse the routing software. Suitable radios can
be found for $50 to $100 at any hamfest.

We've already gone for the CSMA/CA model. It's already a success and
all the users already have radios and antennas to use it. In fact the
same radios they have been using for years for voice. Both the new and
used markets are full of these dual use radios. Requiring users to
buy new dualbanders to play presents a large obstacle to entry into
packet.

>Now, you can all correct me if I am wrong, but if we press for the
>development of a dual band data radio (ie, 2W TC on 440, 220MHz RX)

>operation if we need it to boot. For the 56Kbps modem, a dual band
>transverter would be in order, this, unfortuneatly, would be more
>expensive than the simplex version (A chink in the armour :-{).

Such dual band radios aren't likely to be cheap, the demand will be
relatively small and they can't be used for anything else like voice
or simplex or conventional repeated packet on a single band. This means
that if the repeater goes down, everybody is dead in the water. They
can't go back to simplex because their radios transmit on a different
band. This could be a disaster in emergency communications. There
won't be any on the used market for a while where $50 radios suitable
for packet are now common. All this to partially close a 120 ms window
of vulnerability to collisions. And it doesn't really even do that.
All you get is the ability to abort a frame in progress rather than
waiting until it is over to do the retry. You still have to do the
retry.

>Now, if you use a dual band (ie 220MHx TX and 440MHz Rx) regenerative
>repeater, cheaper, since we do not need cans for it. The the single band
>repeater would require cans. We could run CSMA/CD with the dual band data
>radio with, I am sure, a simple mod to the KISS EPROM firmware.

Notice now that you are asking for a different radio, inverted from
the user radios at the repeater site. This will be really low volume
and really expensive, but what else is new at a repeater site. In
addition to being backwards from all the users, you still need a stack
of cans equivalent to a duplexer in order to live in the RF environment
of a high site with it's commercial repeaters and pagers. You can't
cut corners at a repeater site. Forget the transmit circulator and
you'll be kicked off the site so quick you'll see yourself going up
the mountain as you come back down.

>Or, we could use these (dual band, user site, and repeater site) as the basis
>for a FULL DUPLEX site to site link. And, my imagination goes wild on what

>we could do if the Repeater was smart (rather than simply just regenerative)
>and run Half or Full duplex operation to the repeater (if it was a gateway)
>depending on what you need at that instant. My bwain hurst just thinking
>about all the `fun' things we could do with the channel.

Running a true full duplex trunk link is another matter entirely. There,
in a non-contention environment, you can fully use the back channel while
transmitting on the forward channel. Not only does this immediately double
your channel capacity, but you don't have to stop and wait for acks and
a sliding window protocol really works. Now this is a nailed up bidirectional
link that no user on a LAN could achieve. A totally different situation.
And it doesn't matter as much that it isn't cheap because there are fewer
trunk links than users and all can chip in to pay.

Packet can't grow in a vacuum, there are practical reasons why CSMA/CA
was the choice made for user LANs. Crossband repeating solves a small
problem while creating others, such as the inability to form ad hoc
emergency networks, that are much worse.

Ok, so I assume that you are talking of doing a character-by-character
comaprison (taking into account the link delay, of course) of the outgoing

data with the incoming data. As soon as you get a mismatch, you assume that you had a collision and immediately stop sending.

One problem with this scheme is that it assumes that a character stream of the incoming data is available. This is fine on a Zilog SIO or SCC but won't work on any chip that buffers incoming packets (like most Ethernet chips) where you don't have easy access to characters as they come in. Buffering becomes necessary as data rates increase--you can't affort to touch each character as it comes in our goes out.

The scheme may work just fine at low data rates with a Z80 based TNC. It might even work at 56kb with a souped up TNC. I wouldn't bet on much more. It is a shame to have the TNC as the limiting factor on the maximum link data rate.

However, a more serious problem is that you can only detect collisions in the data portions of the frames (where characters are being sent that you can compare). If the keyup/synchronization time is long, you won't gain much from this scheme because you won't be able to detect collisions until well into the packet. For a pathalogical example, let's consider a 56kb system.

From the paper in the 6th CNC, WA4DSY's modem takes 10 to 13 ms to stabilize before data can be sent. Assuming that the repeater is regenerative, let's make the total delay 20ms. The smallest AX.25 packet (about 14 bytes) takes 2 ms to send at 56kb. So the total time to send this packet is 22ms, and you can't do collision detection for the first 20ms! Doesn't sound like much of a win if you can't do any collision detection for 90% of the packet.

If you can't do collision detection for most of the packet time, you might want to consider simplifying the collision detection scheme a bit. Instead of a character by character comparision, do a packet by packet comparison. After you send a packet, it should be sitting in your input queue. If it is not, you assume that it collided and queue it for retransmission. This method works well with the fancier chips that do buffering, but might have problems if your link to the repeater is weak (lots of unnecessary retries by the sending station because it can't hit or hear the repeater well).

>Afraid to write software? and you are on a computer network? Wow ... The
>complexity `may' come in on making full duplex radios, but I am sure that
>a Full Duplex KISS TNC can handle the vulgarities of collision detection.

Nope, not afraid of software. In fact, my design style leans toward doing as much as possible in software with minimal hardware. For an extreme example, look at Poor Man's Packet (PMP).

In summary, I'm still not convinced that collision detection as you propose is worth the trouble. The "complexity" may be minimal: just a little bit of extra code. But you pay the price in performance: you are now doing a full-duplex link on a character-by-character basis--this puts a limit on the link rate.

Also, I don't see any big performance improvements for collision detection scheme you propose. I believe the question was asked before, and I'll ask it again here: can you quantify the performace gains from adding collision detection?

Assuming 1200 baud AFSK, a simple Bell 202-type modem would do
this just fine. I doubt you'd obtain any significant advantage
from further bit-bashing.

But we don't _have_ to be sure - only "reasonably sure".

> This implies store-and-forward at level 2, in other words a frame-level
> (as opposed to a bit-level) repeater.

You've never used a digital DUPLEX repeater, have you?

It's EXACTLY like a _V_O_I_C_E_ repeater! It's NOT a DIGIpeater,
tcp/ip gateway, netWRONG, TheNet, ROSE, or any of this other store
and forward electro-junk.

You send a packet on channel A, and it sends it right back out on
channel B, where everyone else is listening.

IMMEDIATELY!

You could use it for VOICE.

That's why some will add a modem to decode, then immediately regenerate,
the packets. (Of course, this "cleans" them up, too.)

-o-

We have 2 of them here in Los Angeles, and the problems you imagine
are not significant realities.

What you'd gain in the way of the tiny percentage of corrupt packets
not retransmitted, you'd lose many times over in collisions and wasted time.

> I suspect the FCC may take offence at any repeating of incomplete frames,
> or those where the 'callsign' octets have been accidentally modified....

I suspect they don't, any more so than voice repeater sysops could
be found fault with because a user is in a grungy area and can't
properly identify. None of our repeaters have been cited thus far,
and I'm not anticipating any.

The FCC is not some hideous monster waiting for the opportune time
to strike at our collective jugulars. They realize that some packets
will be corrupt.

> If you just regeneratively repeat at the bit level, without checking the
> validity of the bits in their level-2 context, there is a strong possibility

This is rare in the real world of duplex packet repeaters.

> For example, your DCD or Statemachine may be triggered, so you start
> repeating on the output frequency, then you get hit either by a
> burst of intermod, or a 'hidden station' stamps on your repeater input
> frequency.

nope - the DUPLEX repeater is transmitting, so all other stations
on the repeater pair HEAR it and DON'T transmit.

Let me reiterate for the giggly-zillionth time:

On a DUPLEX PACKET REPEATER (it's like a VOICE REPEATER), there are

****
_ N _ O _   _ H _ I _ D _ D _ E _ N _   _ S _ T _ A _ T _ I _ O _ N _ S _ ! _
^^
****

A "double" is a rare occurrence, especially if all are using sensible
p-persist settings.

Intermod is not a significant problem at decent sites with properly
designed repeaters.

> The smart repeater should detect this, and stop repeating; but

> The only case where i can see a legitimate use for bit-level
> repeaters is where there is nobody else using the frequencies, both
> the repeater and the stations it links are using highly-directional beam
> antennas, and the link shows a very low error rate..

You're needlessly complicating things, and the potential return is
so small as to be insignificant.

The pair would have to be a coordinated repeater pair, of course.
Directional antennas are nice, but not nearly as mandatory as you imply.

They work marvelously over wide areas - at 1200 baud, 9600 baud, and
even higher baud rates.

> An example would be to link two adjacent valleys, on a dedicated
> frequency.

This would be a PAIR of frequencies - just like a VOICE repeater!!!

> In other cases, it seems to me that frame-level repeaters are the preferred
> solution.

You're still left with hidden terminals with frame level repeaters,
because of the non-immediate capture of the frequency.

Duplex packet repeaters DO work - orders of magnitude better than ANY
store and forward system I've ever seen.

I do not see how a full-duplex repeater can cure the 'hidden station'
problem. While this may work in a fully-connected system,
topography and propagation make it a false assumption for the real
world, where re-use of frequencies in adjacent areas is essential.
The analogy of voice repeaters is flawed, since voice repeaters *do* provide
filtering, on the basis of PL or CTCSS tone. They do not repeat everything
(though at times it sure sounds like it!).
Dana's idea of repeating everything is spectrally inefficient and seems to
be contrary to basic logic; IMHO you should establish a principle of only
repeating that which is necessary. In other words, the repeater should
be seen as a 'regenerative bridge/router'. We should be using the model of
two or more LANs linked via a brouter rather than a 'super-line-driver'
repeater that simply passes everything.
Think like 'linking spatially-separated sub-nets' rather than 'extending a
single network'.

I'd like to gather the information as to how the various modems are
interfaced with radios. Obviously, folks have accomplished this, but there
doesn't seem to be a compendium of details for a person that has modem X and

radio Y and doesn't know where he should stick the wires in. If people will
send their details, I will archive them and have them available on an
anonymous FTP site, probably csseq.cs.tamu.edu.

If this already exists, please hit me with a rubber chicken and correct my
ignorance.

73, Kurt

We have tried to make a TNC2 with fast parts do 56 kb duplex. *We*, Grapes,
can't do it. Good luck. We've moved on to other methods such as the
PI card and the Gracilis cards. You can't get around the time of flight

problem. In most cases the packet is just starting to come out of the
repeater as we finish sending it. Adding a long "destroyable" header
just wastes channel time. Even the TCP/IP header causes an annoying
loss of thruput.

This is not a software problem. Primarily it is a physical problem that
needs physical remedies that the speed of light prohibit in reasonable
LAN sizes.

The errant user wises up anyway when he finds he has no thruput. He then
goes elsewhere and stays there. We have two LANs serving metro and people
do stay where they belong. Because that's the only place where their
systems work.

>1200. They minimize QRM by keeping power to what is actually legally
>required; the minimum to communicate.

And I think you are missing my point, most users don't leave their
stations turned on 24 hrs a day and there's no reasonable way to
force them to do so. That leaves lots of people with *no* connectivity
most of the time. That's simply unacceptable. Power control is not
a viable option when you are separated from the nearest active user
by solid granite.

>Who pays for them? Anyone who wants to be part of this particular
>high speed system. Depending on how you view it, it's either
>"democracy" or "anarchy" :-)

He who pays calls the tune and when he decides to go on vacation or
otherwise shut down his *personal* station, numerous users are *cutoff*
from network access until he decides to come back on. We've been down
that road, it doesn't work.

>As far as halving thruput with each hop, a system that begins with a
>very high speed can afford to do that.

If we get T1 it will be on fixed links so dynamic power control
doesn't enter in to the equation here either. On lower speed channels
every bps is precious.

>If the unwashed masses want to use boring 1200, they're still welcome
>to do so, and a bent pipe duplex repeater will work miracles for them.

   Let me try this just one more time... by making all transmitters
visible *in real time* to all other stations *using the repeater*,
there are no hidden transmitters. This statement sort of explains
itself. By making it so all stations can see all transmitters, there
are no hidden transmitters. I do not know how to make it any simpler.

>The analogy of voice repeaters is flawed, since voice repeaters *do* provide
>filtering, on the basis of PL or CTCSS tone. They do not repeat everything
>(though at times it sure sounds like it!).

  Your understanding of the analogy of voice repeaters is flawed.
Until recently, most voice repeaters in Northern California had
no CTCSS. They repeated everything that achieved enough quieting
to break the receiver squelch. As a result, you sometimes heard
people that were too far away to hear the repeater. However, these
stations were always quite weak and easily captured, and it is
not illegal to capture them since you are not jamming their
two-way non-broadcast operation. However, this is not a case
of hidden transmitter syndrome. It is a case of exposed transmitter
syndrome.

>Dana's idea of repeating everything is spectrally inefficient and seems to
>be contrary to basic logic; IMHO you should establish a principle of only
>repeating that which is necessary.

  Gary KE4ZV recently posted empirical observations that indicated a
LAN running on a duplex repeater provides generally twice the throughput
(much more under heavy loading) than a simplex digipeater based LAN,
which refutes your statement of spectral inefficiency.

  I didn't invent duplex repeaters. They were invented before I was

born. I didn't invent duplex data repeaters; they were invented while
I was not paying attention to packet. However, when I discovered them,
I studied up on them and discovered they did indeed solve many of
the problems of providing useful LAN service without requiring any
changes (other than frequency) of the users.

  Since you obviously don't understand how duplex repeaters work
yet, I suggest you stop criticizing them and actually learn
how they work. Refer to the Proceedings of the Sixth and Seventh
ARRL Computer Networking Conferences as a start.

I own an Icom W2A and a HP 48SX calculator. The 48SX is hp's
newest top of the line calculator that just came out about a
year ago. What makes is interesting is that it has a serial
port, and a full a-z character set. I only use the serial
port to interface the hp to my computer to transfer programs
and such, I was wondering if anyone has ever written packet
software the the 48sx? It would be just about the smallest
portable packet station you could get, when combined with
a HT.

I own a W2A and in the process of getting a 48sx. I believe that it has kermit
built into the internal software and that an interface kit for it only costs
50 bucks or so. I'm expecting to have mine up and running on packet as
soon as I finish the TNC I'm building for a school project. Ought to work
just fine!

>access methods will again reduce the collision rate.

True, but extra care will have to be taken to keep the network stable
under overload. Much of Ethernet's incredible robustness to
pathological overload comes from its collision detection feature.
Instead of avoiding collisions completely (which is impossible), their
cost is greatly reduced by cutting transmissions short as soon as a
collision is detected. If you don't abort collisions, then it's easy
for the network to collapse under load; as the load increases, the
percentage of collisions which waste network bandwidth increases, and
the network capacity goes down. There *are* other ways besides
collision detection to keep the channel stable, but they involve more
complex protocols (like MACA).

>
>If you have hidden terminals (i.e., there are stations B and C that can

Which specific CSMA/CA are you referring to here? My MACA protocol
(both the explicit and implicit versions) are designed to handle this
situation - stations B and C will hear packets from A that inform them
that A is listening to stations they cannot hear directly, and they
will defer. In a sense, it is a single-frequency version of busy-tone
multiple access.

]like the current AFSK modems that try to operate through voice radios.

Actually, from what I've been learning about cellular radio (and
frequency reuse in spectrally efficient, i.e., interference-limited
systems), it's not so much the 1.2 Hz/bit/sec figure of the WA4DSY
modem that makes it more efficient, but the fact that it uses much less
energy to send each bit than does AFSK/FM. This affects how closely you
can space co-channel transmitters without mutual interference, which is
the single most important factor in overall spectral efficiency.

I still hear lots of doubles on FM voice repeaters, especially in N-way
random roundtables...

The "special hardware" required for full duplex CSMA/CD could be as
simple as a second radio (on a different band, to eliminate the need
for a duplexer). OSCAR users have been doing this for years. Yes, you
do need special software, but once this has been written it can be
much more easily duplicated than special hardware.

>Such dual band radios aren't likely to be cheap, the demand will be
>relatively small and they can't be used for anything else like voice
>or simplex or conventional repeated packet on a single band. This means

We have to get something straight first, I was thinking of a system of
9600/19.2K repeaters requiring the data radios. There are no used radios
that work adequately on 9600 unless they are hacked carefully. The cost
of hacking a radio is VERY close to the price of a cheap data radio. The
Data radio uses separate transmit and receive sections so there should be
no difference in the cost between a single or dual band data radio. The
Gracilis data radio goes for about $169, I see that is CHEAP ...

>that if the repeater goes down, everybody is dead in the water. They
Agreed ... but our experience has been that we are dead in the water
when we loose the node (on 1200 Baud packet) anyways unless there is
a backup node.

>All you get is the ability to abort a frame in progress rather than
>waiting until it is over to do the retry. You still have to do the
>retry.
I proposed a junkable header to look after this, The offending station
would get off to let other stations use the channel instead of tying up
the channel for however long the packet is. The junkable header (length
should be configurable) would be unique, and easy to check and would
allow the `first' station perhaps some ability to use the repeater after
all contenders have gotten off. This adds some (software) complexity by
requiring a station to `know' that it was the first one because the
first part of it's header was not corrupted, and may be an unreasonable
design parameter anyways. Just think of two ftp sessions going on, large
packets, and a collision occurs, I would guess the channel is unusable
for 5 seconds in CSMA/CA, but could be reclamed immediately with CSMA/CD.

>>Now, if you use a dual band (ie 220MHx TX and 440MHz Rx) regenerative
>>repeater, cheaper, since we do not need cans for it. The the single band

>addition to being backwards from all the users, you still need a stack
>of cans equivalent to a duplexer in order to live in the RF environment
>of a high site with it's commercial repeaters and pagers. You can't
Touche' (perhaps, we are talking about a network of 2W repeaters, high places may not be as necessary, RF cells is the design consideration here), I guess my point for a cheaper repeater are for naught, but the price should be about the same as the simplex anyways.

>Packet can't grow in a vacuum, there are practical reasons why CSMA/CA
>was the choice made for user LANs. Crossband repeating solves a small
>Problem while creating others, such as the inability to form ad hoc
>emergency networks, that are much worse.
The 1200 Baud system is the BACKUP emergency network, I do not expect it to go away as I still see people checking into Landline BBS' at 300 Baud ... However, I am arguing for the fastest network we can get for the same cost as the CSMA/CA systems that are starting to pop up. The power users are going to expect SPEED out of the ether, and I for one am dismayed at the CSMA/CA compromise on higher speed packet.

Sure, it would be nice to get CSMA/CD at 1200, I guess, but lets leave 1200 as the `cheap' system makeing protocol improvements to get rid of it's disadvantages to make it a viable backup network.

>
>We have tried to make a TNC2 with fast parts do 56 kb duplex. *We*, Grapes,
>can't do it. Good luck. We've moved on to other methods such as the

I based my statement on the fact that KISS56 runs on a 5MHz Z80, I am sure a CSMA/CD system can run on a up to 16MHz Z80 (available and cheap, the Z80H above is only a 8MHz part). The conversation between the host and the TNC is a problem, but as we make the software smarter, we could add filtration to keep the packets that we have no interest in from hitting the KISS link. I know that KISS is not to understand protocols on the air, but the destroyable header that I ask for is for the link layer protocol, not for the host, and it would provide this kind of control (expanding KISS to add power control, `some' acquisition for S unit reading and a packet transmitted status message along with this `budlist' kind of control).

I have seen a 33MHz 386 NOT handle 4800 Baud just because the network card interrupted the processor on EVERY network transaction, hardly an acceptable solution on the hardwire networks, why should it be acceptable on packet.

Methinks GRAPES took the easy way out and assumed the PC would be here forever, but I can not use this system since I own a NON ?86 Unix Box. You guys locked me out !!! (How were you to know a 16MHz Z80 was coming out)

>PI card and the Gracilis cards. You can't get around the time of flight
>problem. In most cases the packet is just starting to come out of the
>repeater as we finish sending it. Adding a long "destroyable" header
The 56K modem has 4 bit delay, the 9600 regenerative has a 1 bit delay, the bent pipe repeater has NO delay. There is a TX delay that is in the order of 5ms in the Gracilis data radio as an example. I expect the destroyable header to be in the order of 10ms (10 characters at 9600, 60 at 56K see more below).

>just wastes channel time. Even the TCP/IP header causes an annoying
>loss of thruput.
(That is what Raw IP is for).

>This is not a software problem. Primarily it is a physical problem that
>needs physical remedies that the speed of light prohibit in reasonable
>LAN sizes.
2*(30Miles/186000Miles/sec)*56000bits/sec*(1/8)chars/bit = 2 characters !!! speed of light is `there' at 56Kbps, but hardly an issue as compared to realizable TX delays of 5ms (35 chars at 56Kbps). However, this is still small with respect to the packet sizes I expect to see (greater than 4096 at 56Kbps, greater than 1024 at 9600).

Next ...

>comparison (taking into account the link delay, of course) of the outgoing
>data with the incoming data. As soon as you get a mismatch, you assume
>that you had a collision and immediately stop sending.
Yup, mainly because I am thinking of using a TNC-2 as the controller to keep me from being tied down to any specific host processor platform, and because of a Firm conviction on my part that the TNC-2 can be souped up enough to handle up to 56Kbps effortlessly.

>won't work on any chip that buffers incoming packets (like most Ethernet
>chips) where you don't have easy access to characters as they come in.
>Buffering becomes necessary as data rates increase--you can't affort to
>touch each character as it comes in our goes out.
As the complexity of buffering is added, a small microcontroller, I would see no problem with adding additional hardware to make the collision detection work at higher speeds. Higher speed LAN cards are smart enough to only interrupt the host processor when a packet that is associated with the host processor is being processed, sounds pretty smart to me, a delayed collision detect would be a trivial problem to implement in hardware. A bucket brigade that matches the destroyable header to the shifting value of the received packet would be simpler than the buffer control hardware.

>The scheme may work just fine at low data rates with a Z80 based TNC. It
>might even work at 56kb with a souped up TNC. I wouldn't bet on much more.
>It is a shame to have the TNC as the limiting factor on the maximum link
>data rate.
For now, true, but I expect that at higher rates than 56Kbps, 1Mbps for example, hardware will be honed quit adequately for the purpose. Collision detection may not be an issue as compared with Transmit and Propogation delays and bandwidth requirements. If we NEED a link that fast, I expect that Spread Spectrum technology or single dedicated users (backbones) we forgo ANY collision detection.

>From the paper in the 6th CNC, WA4DSY's modem takes 10 to 13 ms to
>stabilize before data can be sent. Assuming that the repeater is
>regenerative, let's make the total delay 20ms.
Not a problem since I expect to keep the transmit side of a regenerative repeater always active, keying the transmit finals ONLY. I expect that the community will demand quick keying on the repeater, heck, the repeater could be keyed up ALL the time ignoring the power consumption and legalities of the situation which would give us a 4 bit time delay at 56KBaud.

I may have missed the point here, as I have not perused the details of this stabilizing time. Is the stabilizing time based on transmit (no problem), or receive locking (A BIG PROBLEM)?

>If you can't do collision detection for most of the packet time, you might
>want to consider simplifying the collision detection scheme a bit.
>Instead of a character by character comparision, do a packet by packet
>comparison. After you send a packet, it should be sitting in your input
>queue. If it is not, you assume that it collided and queue it for
No gain here, Collision detection should prevent access to a channel, not give blanket permission to make it unusable for the entire length of the packet.

>, but might have problems if your link to the repeater is weak
>(lots of unnecessary retries by the sending station because it can't hit
>or hear the repeater well).
Well, this reality may be the ONLY problem that I see, but a weak station, if the collision detection is done character by character or bit by bit, will immediately sense it's folly and get off the air. An annoyance to the user, but a reality of HIS situation (I do feel pity, but hopefully HIS community will feel pity and set up a linked repeater closer to his station).

>Nope, not afraid of software. In fact, my design style leans toward doing
>as much as possible in software with minimal hardware.   For an extreme
>example, look at Poor Man's Packet (PMP).
Your Hired !!!! :-)

>Also, I don't see any big performance improvements for collision detection
>scheme you propose. I believe the question was asked before, and I'll ask it
>again here: can you quantify the performace gains from adding collision
>detection?
No I can't on an RF LAN. CSMA/CD is a requirement on wired networks and there IS an improvement. On a RF LAN, the only way we can guarantee this similar improvement is to keep the repeaters running at top efficiency (keyup time).

This improved efficiency `may' cost, but IMHO it is simply good hardware practices (keep TX section `just' ready to key up) and not unusual or complicated hardware that will provide this.

Any delays in the repeater, double it (due to my suggestion of a destroyable header), and that is the window for collisions to occur. This overhead WILL have a major effect on the payback of CSMA/CD and I do NOT have the tools handy to figure out where we loose this payback as compared to CSMA/CA (I was hoping that the net would have a guru with the numbers). Someone out there should have a network simulator package that can have a RX delay automatically added back in.

But, a cursory view, for average 1 second packets at 9600 Baud and a 20ms (highly conservative) delay would only yield a 2% increase in channel efficiency over CSMA/CA. But, if we include the ACK and other short packets (<40ms) as well into the average, I expect that the improvement would be closer to 10% (a guess) on the above case because CSMA/CA would have distint

problems even knowing that a collision occured on the short packet, causing an unnecessary retry, in the case of the ACK packet (my guess would be larger, but there are software schemes that will help the CSMA/CA case due to everyone understanding priority acknowledge). Idealy, CSMA/CD ONLY has a 20ms header wastage, the channel can be used FULLY, while the CSMA/CA schemes often requires the channel sitting idle for extended periods of time to work (the backoff algorithms and random waits after collisions) easily wasting more than the destroyable header and repeater delays in channel access.

Thanks, 73 de VE6MGS/Mark -sk-

 You are correct. The 48sx does have kermit built in. That is what I use
 to communicate with my PC. I bought the interface cable. It can be
 picked up for $30.00 if you know where to buy it, and dont bother
 to buy the software with it. Kermit can be found almost anywhere.
 But, is kermit what youd want to use to communicate to a tnc?
 The 48sx is fully programmable, and I think you can program the serial
 port to do whatever you want. I would just think you'd want to open
 it and have it act like a dumb terminal or something, not run kermit.
 Kermit is good, but do Tnc's support it?

I've decided that the claims that duplex repeaters are spectrally
inefficient ignore the following facts:

    Duplex repeaters use two frequencies for X amount of time.

    Simplex digipeaters use one frequency for 2*X amount of time.

    The "time-bandwidth" product is the same.

    The duplex repeater reduces the chance of collisions at
    least 80%.

    The real time elapsed to send one packet to another station is
    half as much.

Maybe in your part of the world repeaters all use CTCSS. Here we use
frequency coordination. The only two machines in Atlanta that use CTCSS
do so to keep the riffraff out and not because they have co-channel
interference. The rule is 175 miles separation co-channel and 75 miles
first adjacent channel. Unless there is a monster band opening, there
is *no* interference. For example, the nearest co-channel machine to
the one I own is 250 miles away. We've only heard it once, and have
never heard it's users through our machine since they are lower and
run less power. There are no hidden stations except for a few lids
who tried to operate simplex on the repeater input channel. We T-hunted
them and flagged them to the FCC. Problem solved.

>Dana's idea of repeating everything is spectrally inefficient and seems to

>Think like 'linking spatially-separated sub-nets' rather than 'extending a
>single network'.

Think simple connectivity. Many of our users would not be in range of
any 24 hour station without the repeater. Store and forward halves
the effective baudrate. Store and forward inevitably has hidden terminals.
A repeater has neither problem and offers 24 hour connectivity to all
users.

Let me address this in two ways. First, the bandplan allows us 100 khz channels of which we only occupy 70 khz. So adjacent channels actually have 30 khz guard bands. This isn't generally necessary with the WA4DSY modem. Operation on 70 khz channels at the same site is possible, though the guard band helps if one of the signals being received is weak. The spectrum is very bandlimited. Second, capture. One of our sites is 57 air miles from it's neighbor and another site is 20 miles from the same neighbor. The closer site will reliably capture the channel from the further site. In this case this is a bug not a feature and we are transposing the two sites' links to the common neighbor to different channels to avoid contention. As a side note, all our links run from 3 to 7 watts into either gain omni antennas or beams. What will kill a link, however, is narrow band interference located inside the channel spectrum. It totally screws up the slicer bias and kills us dead.

>random roundtables...

People aren't as good as machines at implementing an optimum random backoff protocol. We added a double beep to one of our repeaters that helped a lot. Somebody wanting to interject a thought keys between the beeps and normal flow waits for both beeps. That simple little change made a world of difference in reducing doubles. If somebody is consistently too quick on the trigger, we follow him around at the next club social and chant "Wait for the beep!" Very effective.

That's a good question. The poor man's packet TNC with the software ported over to the 48SX would* be the ultimate in small packeteering. Unfortunately, I don't have my 48 yet, (sniff) and have to wait another week I guess. I'll

begin on the project as soon as I get it though. If it is possible to program the serial port directly and not bother with the kermit program, so much the better. I do know that it will* work with kermit though. I know a couple of people who have used kermit or cyterm with their TNCs and had them work.

I find this discussion fascinating. For our call on the issue, please see the 10th ARRL Computer Networking Conference Proceedings (1991, San Jose,CA) for our article "A Full-Duplex 56kb/s CSMA/CD Packet Radio Repeater System", by me(Mike k3mc) and Lars Karlsson, AA6IW.

Basically, collision detection is done by comparing the bytes being received with the bytes being transmitted, taking into account repeater delays. And the repeater runs the same code as the user station.

The user station consists of a Hamtronics XV-4 transverter (29 MHz to 433 MHz) and an SHF electronics 900 MHz transverter, with just the receiver part populated. The digital controller is a Kantronics Data Engine.

We've got the h/w together, and expect to get the s/w running during the Christmas vacation.

I've run into a nasty problem after putting up my new dual-bander
antenna (Cushcraft AR-270). The external antenna, now mounted in
front of my house and soon to go up on the roof, certainly solves the
original trouble I had; interference from my computer and TNC are
completely eliminated, and I can finally run a packet operation... of
sorts.

The problem is that the antenna seems to be too good for the front end
of my Yaesu FT-470 HT. I get public service -- police, coast guard,
and who knows what else -- splattered randomly around 2m; perversely,
it seems to be concentrated on the packet frequency I use most often,
though that might just be my paranoia. Anyway, the result is that,
depending I suppose on whether the police are having a busy day or
not, packet operation ranges from slow (lots of retries as incoming
packets are disrupted by a "MAN WITH A GUN ON 12th ST") to impossible
(so many retries that the poor TNC's give up). No way to be running.

Does anyone have any suggestions as to what I could do? Preferably an
>inexpensive< kind of solution... I'm definitely low-budget nowadays.

Thanks a lot for any suggestions, and
73

Does the new version remove the two-hop digipeater limitation that was part of
earlier versions? That limitation prevents a ROSE network from being useable
with other networks.

>Gary KE4ZV

Gary, and all,
  My major thrust in packet involvement in the past 6 or so years has been in motivation. I think that what you are saying is that the technology isn't a limiting factor in making a 'good' network for your area. You are limited by funds and lack of interested hams. I think that a large portion of this conversation/thread can be short circuited if the problem of lack of motivation is specifically addressed.
  A VE6 made a comment in this thread as well about the rediculousness of telling all of the Alberta packeteers that they must implement high tech or at least relatively complex hardware instead of their 145.01 digipeaters. Indeed it is rediculous. The trick here is to demonstrate the value of the complex implementation and then ride the wave of enthusiasm. If you can't demonstrate your proposal well enough to get popular support then there isn't any need to discuss the implementation plans now is there?
  My proposal of three years ago was to take multiport TheNET nodes and set them up with dedicated point to point links. Each site is linked to each other site by a UHF radio pair. That means at minimum 3 radios per site, 2 on UHF and 1 on 2m for user access. All servers (ALL of them) use dedicated links to each other and to the network nodes.   Repeaters may be used in place of 2m user access ports and, depending on performance vs traffic, for server access points.
  In the past three years the club that I helped form to implement this plan (North East Digital Association) has succeeded in promoting some 200+ radios to be used for networking, not to mention the servers and etcetera. We now have a workable network from Boston to Erie Pa. By workable I mean that any station can get on and connect to any other station along the network, 24 hours a day, without fear of getting dumped.

The whole key is motivation, not technology. Start simple, keep it simple. Software is secondary, so is hardware. Be public. Spread documentation to EVERYBODY, users, server ops, node ops, disinterested parties. Make sure that ALL hams understand that they can play a part if the follow the simple ground rules. Now that we've a network all sorts of neat stuff is showing up on it. TCP/IP, DxCluster, DOSgate, BBS stuff, round tables, callsign servers.. 280 members and going strong.

By the way (this is a plug) if you are interested in this club, they publish lots of good stuff including a Quarterly journal which comes to about 200 pages per year. Membership is $15/year and does NOT support any hardware. NEDA, POBox 563, Manchester NH 03105.

>digis.

Your comparison here says that a repeater is better than two simplex digis.
This is VERY true. However, a repeater might not be at all as good as
separate dedicated links to each station. In some cases dedicated links
may be justified. Some times taking heavy users off the repeater and
giving them dedicated links can save the day. This is the case currently
at the WA1TPP repeater in Springfield Mass. The repeater is being used
as a routing point for 2 VHF user access points, two NOS nodes and three
bulletin boards. This is too much. At 1200 baud across the repeater
there just isn't enough bandwidth. With dedicated links to each of the
users the throughput would be much higher. (Best case 7x better).
Replacing the repeater with seven half duplex radios wouldn't even be
that expensive. The repeater has duplexers and has Tx and Rx that must
support a link to the weakest user. Most of the users can access the
site with 1 watt. So, the site's repeater could be replaced by 5 dipoles
with 5 1watt handie talkies, two yagis and a pair of 20 watt xtal mobiles.
Seven modems/ network ports would also need to be added to provide
switching. However, considering the improvement in throughput and the
fact that the repeater's omni is being replaced by a pair of yagis to
the worse case stations the actually emitted RF at the site goes DOWN!
This is a savings of spectrum! The 1 watt signals wouldn't be heard
anywhere near as far away as the repeater and it's omni was.
  Interesting conclusion eh?
This is

Sure. Build a narrow *bandpass* filter to put between your radio and
the external antenna. HTs are made very sensitive so they can be used
with rubber dummy loads, and they are very wideband for those who want
to illegally go out of band. They are natural intermod generators. The
bandpass filter will put them back the way they should have been manufactured
in the first place and the junk will disappear.

>You guys locked me out !!! (How were you to know a 16MHz Z80 was coming out)

Intercooled turbocharged Z80s notwithstanding, we hit a limit of 19.2 kb on the serial link to the PC using interrupt per character. With 16550s and careful tweaking, 38.4 kb is barely possible. We realized we were flogging a dead horse fighting an async link when we should be using DMA and interrupt per packet instead. Now, with no special driver tuning we can handle multiple 56 kb modems simultaneously. We didn't lock you out, you're free to go your own way. I'd suggest you hack an 8530 on your machine and write your own driver. Or if your machine has a smart serial controller, then bolt a Kantronics Data Engine on and let her fly. Now that's a super TNC that can fly. Actually, the best way we've found to tie a Unix box into the system is to take a cheap 286 motherboard and stuff a PI card and an ethernet board in it and let it act as the radio interface. Three of us do this at home now.

Doing protocol and power control in the TNC2 is beyond reason at 56 kb. We had to produce a special "tweak" version of KISS just to handle the radio channel at 56 kb and the serial link at 19.2 kb. The Z80H's timing margins on reads are so slim already that we had to hand select ROMS to avoid wait states. Going to the V40 DE56 allows you freedom to do more, but it costs as much as a clone PC and spare parts aren't on every street corner when lightning pays a visit to the switch site. Some PI

cards in a cheap 16 Mhz 286 clone lets you fly at the same cost with
easier availability of spare parts. We have 8 active switch sites with
4 more coming on line. They all have multiple ports. We can't afford the
downtime of a low volume specialty item for our switches. We have several
of the cheap PI cards on hand and 20 minute availability of PC motherboards
and power supplies. Anybody seriously building a network has to consider
the cost and manhours required for maintenance. We don't have the time to do
component level repairs anymore.

We're operating a production network with carefully drawn LANs serviced by
duplex repeaters, simplex store and forward, and 56 kb trunks interconnecting
the LANs. We regularly service 500 in state stations and pass thru hordes of
out of state traffic without bottlenecks and congestive collapses. We even have
a 56 kb repeater in the works for the real speed demons, not to mention a
couple of nuts pushing ethernet baseband over a 10 Ghz link. We even still tie
in antique simplex KA-nodes, Netwrongs, and creepy ROSE stuff. Our charter
is to common carrier anything that comes our way. That's not easy and
there are some real kludges at the fringes and connectivity isn't always
perfect, but we're trying with little manpower and small dollars to
achieve a quality system that everyone can use.

We have a user using a HF rig driving a transverter, several old GE and
Motorola boat anchors, bunches of IC22As, rubber ducky HTs in apartments,
multi-hundred watt Oscar stations, and hordes of top line ricebox users.
Everything from Silent 700s to Unix boxes generate the data. Our MacIntosh
user left town. We've got to service them all.

I don't consider our 56 kb system brute force. We only occupy 1.2 hz
per baud. That's much better than the 20 hz per baud of other schemes
like the current AFSK modems that try to operate through voice radios.
Our TR time is under 5 ms and doesn't require a TXD of 50, which equates
to 500 ms in TAPR clones. In that half a second of crud, our system would
have sent 25 kb of data. I prefer the term elegant to describe our 56 kb
modems.

Using voice squelch systems on a data radio is an abomination that wastes valuable channel time for weak noise bursts and stations so far away that our transmission won't interfere anyway. That's what FM capture is for. Not to mention the abominable squelch opening delays that cause other stations to extend their TXD in order to communicate with the slowest radio on the channel. Use of AF squelch is the wrong solution to a mostly non-existant problem.

   Duplex repeaters are *not* avant-garde. They've been around forever, at least 25 years in the amateur radio context. Everyone seems to know how to use one.

I know there is a line in PLL chips that signals when the PLL is locked.
Couldn't this line be wired into the TNC, and replace TXDelay=RaNdOm#?

I know most people want to have the option of removing the packet
radio and not have lotsa wires, but when was the last time your radio
left the TNC.

Right solution for wrong problem.

This Saturday there is a meeting of twinsLAN (minneapolis area
packet radio group). It is at the Paveck Radio museum in St. Louis
Park. Hopefully it won't snow (at least as much as last weekend), and
some folks with good ideas will show up.

What is the idea for the optimum solution? What I would like to
see are multiple freq's. the 1200 baud folks can stay on 145.0X,
the 9600 baud folks can go to 4XX.YY, and the 56KB can be organized
on {900, 1.2G, ...}. Some separation for backbones of traffic, but
most 56KB stuff would probably end up like the internet (hopefully
only the good stuff), with telnet connections, and some FTP, and some
SMTP, this an X session thrown in for keeping things busy.

Yes anything at or above 9600 should be full duplex (actually the 1200
should be also, but who's gonna listen?) This leads to weird repeater
situations, and might be real hard to keep organized.

Probably better solutions would be spread spectrum, or 'cellular' type
solutions. Using the FDDI type protocols, with a specific frequency
designated for organizing the FDDI stuff. How about the 1200baud modem
communicating to a clearing house, asking for a slot in the protocol,
the clearinghouse grants, the 56KB modem listens for the slot, and
handles the transactions. When done the 1200 baud modem tells the
clearinghouse everything is done and the connection is closed.

Thoughts while typeing, maybe none of this makes total sense.

   I'm afraid I don't see the poor logic in this. Of course, I also don't
   see the logic in "as easy as pressing the repeater split button on your
   radio". I don't know about your radio, but that doesn't make mine full
   duplex. I may transmit on a different frequency than I receive on, but

The repeater is full duplex. The users are half duplex.

   I still can only do one or the other at any given time. If that is all
   the users are doing, then there is absolutely no advantage to the full
   duplex digi-peater because you still have the hidden transmitter problem.

No, the full duplex repeater has eliminated the hidden transmitter
problem. *All* users of the repeater can hear all the other users
through the repeater. Another advantage is the lack of store and
forward time.

   In order for this system to work, not only the digi-peater, but all the

> users have to be running true full duplex. They have to be able to hear
> themselves transmit so that they know they have captured the repeater.

This is not necessary. The users running full duplex will sense
collisions but that is a minimal gain compared to eliminating the hidden
transmitter problem, which half duplex users of a full duplex repeater
can do.

> If they have not, then they must shut down the transmitter in order to
> not interfere with the station who has captured it. That would be full
> duplex. Anything less offers nothing and uses twice as much spectrum.

No, this is wrong. To summarize:

```
               The repeater is full duplex
               The users are half duplex
        This is the same situation as voice repeaters
       All stations can now hear all the other stations
             No hidden transmitters
             No collision detection
```

  While I apologize for saying "What poor logic", I must reiterate that I
am talking about *using* a full-duplex repeater. Pressing the repeater
split button on your radio does indeed allow you to use a full-duplex

repeater. No, it does not make your radio into a full-duplex radio, but you don't need that.

>I may transmit on a different frequency than I receive on, but
>I still can only do one or the other at any given time. If that is all

Please explain why we still have the hidden transmitter problem. By making the entire user area audible to all users, no transmitter is hidden. Sure, most radios run half-duplex, but the hidden transmitter problem is (in theory) solved using Carrier Sense Multiple Access, which checks for a channel busy before starting to transmit.

>In order for this system to work, not only the digi-peater, but all the
>users have to be running true full duplex. They have to be able to hear
>themselves transmit so that they know they have captured the repeater.

What you are describing is Carrier Sense Multiple Access/Collision Detection, which is certainly an improvement over the plain old CSMA we currently use in packet. Of course, to actually use CSMA/CD every packet user would require special hardware and software, which makes it rather unattractive....

I must dispute your claim that a duplex repeater provides no advantage. You are incorrect in stating that the hidden transmitter problem persists with a duplex repeater. A properly designed duplex repeater makes all users of the machine equally audible to all other users. There are no hidden transmitters. However, there is still a window where CSMA breaks down and collisions may occur; this is due to the finite delay from the instant a station detects the channel is clear and the point in time when that station can make the channel busy. This finite delay is the transmitter keyup delay and any delay in the signal path in the repeater.

However, it is illustrative to understand how big the collision windows are for the digipeater and duplex repeater situations. We'll assume a 128 byte packet with only one address pair, which results in a packet approximately 150 bytes long. At 1200 baud, this packet will require about 1 second to send. Since most packeteers seem to use synthesized radios with fairly long TX Delays (150 - 200 mS), the total window for collision is 1 second plus the 200 mS, or 1.2 seconds on a digipeater where there are hidden transmitters. On a duplex machine, the only time when a collision can occur is the 200 mS keyup window. The window for collisions on a duplex machine is 17% of what it is on a simplex digi. In the case one is using a fast crystal controlled radio, the TX delay could be, say, 70 mS. Then, the windows are 1.07 S versus .07 S, or the collision window on the duplex machine is 6% of the size it is on a simplex digi. Of course, the collision window is really determined by the slowest station on the channel.

While p-persistance is not a panacea, it can largely mitigate the remaining collision window on a duplex repeater. Overall, under heavy loading, a duplex repeater can provide a more graceful erosion of throughput than a simplex digi. This is certainly an advantage. In fact, it could be the case that a heavily loaded duplex repeater can provide better coverage and efficiency to more users than two simplex digis.

The ability to detect collisions once transmitting helps maintain channel efficiency when the loading goes up. Since this is starting to discuss a less common topic, I'll suggest that interested parties brush up on the advantages of CSMA/CD versus CSMA. A good reference would be Tannenbaum's _Computer Networks_.

Um ... you can e-mail me here for instructions, or e-mail me via the bbs network, or call at my home phone (it's listed) or my work phone.

You can download the latest version from the wa6rdh LL BBS - 916/678-1535 1200-9600 baud, or you can send a formatted diskette / self-addressed mailer to n6iya: John Smith, 1061 Pine Drive, Felton, CA 97007.

Suspect the folks asking for it are not on packet, since all the above information passed through the bbs net as bulletins during the past week.

... Hank

The french packet association (ATEPRA) and F6FBB have implemented ROSE
on PC based on the sources released by W2VY. This version is fully
operational today and will be released. I 'll get a version and put it
somewhere for ftp access. The present version uses serial ports but
8530 will be supported in the future. I'll contact people in France
later this week to get advanced details and schedules.

This is simply wrong: it is NOT necessary for the users to run full duplex for the digital repeater to represent a significant gain in channel throughput. The repeater will eliminate the hidden-terminal problem, greatly reducing the collision rate. The use of p-persistance access methods will again reduce the collision rate.

While it is true that having each user be full-duplex and able to tell whether the signal being repeated is his own or someone else's would again reduce the collision rate, the additional complexity of the required user station might well outweigh the advantages of it. It would certainly be worth a try. Note that for this to work, it is not enough to be fully able to receive whilst you transmit; you must ALSO have some way to tell that the signal coming back from the repeater is yours - which means that you have to decode the header on the packet to see if it's yours. You can't simply X-OR the bits coming back, since there are variable propagation delays. Nor can you examine the voltage level on the cable (which is how Ethernet collisions are detected), since there isn't any relationship between received signal strength and transmitted signals and collisions.

Let's look at a few of these points in a little greater detail.

If you have hidden terminals (i.e., there are stations B and C that can communicate with station A, but not with each other), in the absence of slotting methods, there is a virtual certainty that you will have collisions when B and C both transmit at the same time. CSMA/CA will not be able to avoid these, since B and C can't hear each other to avoid colliding.

If you replace A with a duplex (i.e., two-frequency) busy-tone system, then B won't transmit when C is already on the air, since A will be emitting a busy tone to notify all stations that A's input channel is in use. True, if user stations are all running DWAIT=0 channel access, then as soon as the busy tone stops, they'll all jump on the air and collide.

But if the user stations are running p-persistance and the slottime is set long enough for a station to acquire the busy tone, then when the first transmission ends, each station will "toss a die" to see if it should transmit in that slot. If the station doesn't transmit at that time, then it waits one slot and checks for channel busy again. Thus you have reduced the probability that stations will collide.

[A necessary condition for this is that slottime has to be set large enough to allow stations to determine that the channel IS busy, which means that it must take into account the squelch open time and the detector lock-on time of the typical receiver. For a 1200 bps AFSK system {gack}, probably 250 ms is a reasonable time. Also, the

probability value needs to be set to a number slightly less than the number of stations likely to want to transmit at one time - for a typical metro area, this may be four to eight stations, so you'd set it to 1/4 to 1/8, or 64/256 or 32/256.]

Since having a single station running busy-tone access is unfair and impractical, you instead use a repeater. The repeater is full-duplex, but the user stations don't have to be. Any station using the repeater will be heard by all stations using the repeater, and you automatically get all the advantages of busy-tone channel access and collision avoidance, plus you extend the range of the stations using it.

It is not necessary for the repeaters to be running 25 watts at 2km altitude and covering 10,000 square km; the concept is JUST AS VALID if the repeater runs less than 1 watt and covers just part of a city. This latter cellular approach would allow for geographical re-use of channel pairs, and assuming the repeaters can be linked on some other frequency to provide common network access, all users will benefit from such an arrangement.

However, such a scheme requires quite a bit of cooperation and dedication, as well as what might be an impractical amount of money and sites, so I don't hold out much hope of seeing a truely cellular ham packet radio system any time soon. Would be nice, though.

In the meantime, let's see what we can do to make what we have better. Just because we can't do it all isn't a good reason why we can't do some of it.

Ok, I concede the point. Except (no experience here yet :-( ) I believe many
feel that is the solution to the problem of poorly set up 1200 Baud systems.
I have tripled my throughput by improving my system WITHOUT UNDUELY TAKING
CHANNEL FROM OTHER STATION. Sure, I could set ppersist to 256 and slottime
to 0 .. but I don't. I have a 50ms keyup time (poor relays batman) that I
endeavor to improve. I (and others) have pushed for the DCD mod to allow
shorter TXDELAY/AUDELAY. I have pushed (unsuccessfully) the use of RF
CARRIER DETECT to keep unruly transmissions. I am a saint and my father is
bigger than your father ...

>Using voice squelch systems on a data radio is an abomination that

>radio on the channel. Use of AF squelch is the wrong solution to a mostly
THAT is what I am saying. However, keep in mind that a signal 20dB down
will disrupt FM capture enough to make the packet unreadable (out of full
quieting) so you may be surprised how weak of a station can hurt you. And,
keep in mind that weak station is trying to hit the node, and YOU may be
wasting his channel access by being so unfriendly. Classic Hidden Transmitter
problem.

I proport that an unsquelched high quality audio (usually from the top
of the volumn control pot) AND the squelch busy signal combined provide
your best system for the single frequency compromise. I had to provide
a little bit of audio amplification (6dB) on one of my rigs, but the
other two work fine as is. The squelch busy signal usually needed a
switching transistor or two to get the signal just right. The squelch busy,
backing off your access to the channel, may in fact be improving the
general throughput of your area of influence (for a lack of a better name)
by not allowing you to stomp on `some' of the hidden transmitters.

The advantage, is that you can listen in on the packet channel (to debug

problems and set the squelch regularily if not automatically done) without affecting the TNCs audio.

>   Duplex repeaters are *not* avant-garde. They've been around forever,
>at least 25 years in the amateur radio context. Everyone seems to know
>how to use one.
It is avant-garde if YOU need a duplexer or set of cans at EVERY site just to use the advantages of a regenerative repeater. You do NOT get any advantages (except wasting two frequencies rather than one) unless you can hear the output of the repeater while transmitting to see if you collided with someone. I use avant-garde as a dirty word here (like user friendly) since I see no advantages ... The cost of a duplexer or cans for each user as well as the repeater makes my skin crawl.

Don't tell me that you can hear when you are doubling with someone on the voice repeater. The solution is to go cross band (bent pipe was it?) to make life easier. Again, a cost, since a dual bander DIGITAL radio is NOT available commercially (I think, correct me and I will be converted).

Wow, I havn't held a train of thought this long since I tried to tune a set of dual webbers :-).

Bill, it's the *repeater* that is full duplex, the users continue to
operate half duplex. This gives you reliable CSMA, but as you note
does not give true CD, so collisions can occur undetected if two
users start transmitting at *exactly* the same time. This isn't too
likely for two reasons, the window of vulnerability is small, and
p-persistence randomizes the dwait value. What it does do is totally
eliminate hidden transmitters. This eliminates 99% of the collisions
that occur on a simplex store and forward digipeater.

Since everyone is listening to the repeater output, and the repeater keys
up immediately when a packet appears on it's input, there's no store and
forward delay, most collisions are avoided. In a simplex digipeater network,
many stations cannot hear each other while all can hear the digi. When a
station keys up to send a packet to the digi, he may clobber another station
that is already transmitting to the digi. With a duplex repeater, that is
avoided. Therefore the only opportunity for collisions is the small key up

delay of the repeater rather than the entire duration of a packet. Adding full duplex at the user end only closes that small few millisecond window of vulnerability and gains little in collision avoidance while increasing user station cost markedly by requiring a duplexer at every station. If you detect a collision while running full duplex, both stations, you and the collidee still will have to retry the trashed packets, so unkeying immediately upon CD doesn't help thruput.

I firmly stated:

> Duplex repeaters are *not* avant-garde. They've been around forever, at least 25 years in the amateur radio context. Everyone seems to know how to use one.

And Mark G. Salyzyn (VE6MGS) replied:

> It is avant-garde if YOU need a duplexer or set of cans at EVERY site just to use the advantages of a regenerative repeater. You do NOT get any advantages (except wasting two frequencies rather than one) unless you can hear the output of the repeater while transmitting to see if you collided with someone. I use avant-garde as a dirty word here (like user friendly) since I see no advantages ... The cost of a duplexer or cans for each user as well as the repeater makes my skin crawl.

Now, patiently, I state:

> Elimination of the hidden transmitter syndrome is a major win. Even a half-duplex user of a full duplex machine enjoys this. I have always thought that it is intuitively obvious that making all of the transmitters visible to all the receivers eliminates the hidden transmitter problem. I don't know how to make it any clearer. You don't need to run full-duplex and detect collisions at the user site; it is only an incremental

improvement, which is made less useful by the fact that collisions are less likely.

Don't make things more complicated than they need to be.

In article <439@intran.UUCP> tom@intran.UUCP (Tom B.) writes:
>
>I know there is a line in PLL chips that signals when the PLL is locked.
>Couldn't this line be wired into the TNC, and replace TXDelay=RaNdOm#?

No, because it doesn't answer the fundamental problem. PLL lockup is not the only cause of transmitter delay. Many rigs still use relays for TR. Most switch voltages on and off in the transmit and recieve chains during TR. All this requires settling time. Often the greatest delay in the system is the recharging of capacitors in the audio chain.

Txdelay compensates for both transmitter and receiver response delays. You must set it so that your transmitter has time to get to full power, and so that the *slowest* receiver in the system has time to recover and unsquelch. This is the real killer, the slowest receiver in the *system* determines Txdelay for everyone else. That's why using audio squelch is very very bad. DCD state machines and open squelch speeds up the entire *system*. P-persistence, the random number that determines when Txdelay *starts* is an important *contention* management feature in newer TNC firmware. It is in fact a randomizer for Dwait. It prevents a pair of stations from repeatedly retrying on top of each other and timing out.

>I know most people want to have the option of removing the packet

>radio and not have lotsa wires, but when was the last time your radio
>left the TNC.

Most of the radio *improvements* that could reduce Txdelay are internal modifications to the TR system and require no external wires. They won't affect voice operation. Dedicated RF modems are a better answer to packet radio since they can be optomized from the start for short turnaround.

>What is the idea for the optimum solution? What I would like to
>see are multiple freq's. the 1200 baud folks can stay on 145.0X,
>the 9600 baud folks can go to 4XX.YY, and the 56KB can be organized
>on {900, 1.2G, ...}. Some separation for backbones of traffic, but
>most 56KB stuff would probably end up like the internet (hopefully
>only the good stuff), with telnet connections, and some FTP, and some
>SMTP, this an X session thrown in for keeping things busy.

This is basically what we already do in Georgia, though many of our 56 kb trunks use 223 Mhz because they have to span relatively long distances, our longest hop is currently 57 miles. We use 433 Mhz 56 kb trunks too and try to use a frequency inversion scheme so that adjacent nodes aren't talking on the same frequency. This requires two RF modems at each switch site, but reduces contention to nil. Our 9600 baud work centers on a 440 Mhz full duplex repeater and a 440 Mhz simplex frequency. Our 1200 baud work is divided among LANs on the various 145.0x Mhz frequencies and on a 146 Mhz duplex repeater. Everyone is linked together via the 56 kb trunks.

>Yes anything at or above 9600 should be full duplex (actually the 1200
>should be also, but who's gonna listen?) This leads to weird repeater
>situations, and might be real hard to keep organized.

Full duplex at each user station is not very helpful at the lower speeds, and not really important at the higher speeds until you start to do interactive work with short packets. The requirement for a duplexer or crossband equipment at each user site is too expensive for a large user base to support. Full duplex at a central repeater site is important however. It eliminates hidden transmitters for an entire LAN at the cost of only one duplexer.

>Probably better solutions would be spread spectrum, or 'cellular' type
>solutions. Using the FDDI type protocols, with a specific frequency
>designated for organizing the FDDI stuff. How about the 1200baud modem
>communicating to a clearing house, asking for a slot in the protocol,
>the clearinghouse grants, the 56KB modem listens for the slot, and
>handles the transactions. When done the 1200 baud modem tells the
>clearinghouse everything is done and the connection is closed.

This is only useful when many users have line of sight with each other. That is very rare in our area. When high cell sites are required to give connectivity, cost and complexity of the *system* rise rapidly.

For a really fast switch, you might care to look at the Gracilis
PackeTen product. Although there are currently some rough edges to
smooth out, it has the promise of being the premier packet switch for
several years to come.

It comes in two flavours: one is a PC-based card, the other standalone.
Each handles 5 ports, three of which are megabit rated and the other two
not quite so fast. You can even plug them together to get 10 ports in
a pc-based architecture.

It runs a modified version of Phil Karn's NOS, including a nice net/rom
implementation for backwards compatability with obsolete networks.

We're installing one here in San Diego sometime in the next few months,
with 56kb, 9600 and 1200 bps full-duplex repeater user access, 9600 bps
metropolitan trunking, and it will participate in the California
Intercity network. I think it will give us a really nice network hub
for some advanced packeting. We may even put up a second one someday.

This is the sort of community resource that people CAN get together to
finance and support, and all the packeteers in the area benefit thereby.

To JOHN DOUGLAS:

To help out the countrymen/women of my ancestors (UB5-land) here is what I
got from AA4RE in the way of BBS info. Now, this is what I call service!

*From: Roy Engehausen <enge@almaden.ibm.com>
*
*Version 2.11 of the AA4RE BB program is now available.
*
*The primary advantage of BB over the MBL/RLI/BQE/CBBS.... systems is
*the ability to handle multiple connects per port. The program uses it
*own multitasker and no DesqView, DoubleDos, etc is required. On the
*down side, BB has been optimized for speed and requires at least 512K
*(and usually 640K) to be used productively. Only an 8088 based
*machine is required
*
*BB uses a "host-mode" interface so the only TNCs supported are the TNC-1
*and TNC-2 (or clones) with the WA8DED (or clone) EPROMS installed, the
*AEA PK-87, PK-88, PK-232, and the DRSI PC*PA TNC card. It also runs
*with any KISS TNC using the G8BPQ PC Node switch.
*
*You can get these programs by sending a $5 US (or equivalent) to:
*
* Dave Larton, N6JQJ
* 766 El Cerrito Way, #D
* Gilroy, CA 95020-4149
* (408) 847-3605
*
* John Anderson, N7IJI
* 2729 Park Road
* Charlotte, NC 28209
* (704)-333-3249
*
*Canadians can send 5.00 CDN to:
*
* A.R.E.S. Group
* Att: REBBS Update
* P.O. Box 35
* St-Jean Chrysostome,
* Quebec, Canada   G6Z 2L3
*
*For source code, include $2 more (needs multiple diskettes). We can
*handle all formats of 5 1/4 and 3 1/2 inch diskettes
*

*The software can also be obtained by downloading from the following BBS:
*
*   WA6RDH BBS -- 916-678-1535 -- 300/1200/2400/4800/9600 N81 V.32
*   WB3FFV BBS -- 410-625-0817 -- 1200&2400 (Non-MNP)
*   -- 410-625-9482 -- 1200&2400 (MNP5), 4800&9600 V.32 (V.42/MNP5)
*   -- 410-625-9663 -- 1200&2400 (MNP5), 9600 & 19200 (PEP)
*
*The software is also loaded onto the W3IWI TOMCAT FTP server
*(tomcat.gsfc.nasa.gov) accessible via both SLIP and thru the Internet.
*It is also at ucsd.edu
*
*The software can also be delivered via BITNET. Send a note to ENGE at
*ALAMDEN for deliver over BITNET.

BTW, I have started downloading from TOMCAT. Already sent NT2X the latest copy
of W0RLI. Thanx to Roy's info it looks like the Sov-Hams will have a potpourri
of BBS software to chose from. Now if only governments could share info
this openly 8^)=   73, Walt (Wolodja) Kornienko - K2WK

The idea of bit-level repeaters surely breaks down in
the case of amateur style less-than-100%-reliable paths, and when the
system is not fully-connected (hidden transmitter problem).
Only by receiving the *whole* of a frame (assuming we are using
HDLC and AX25) and performing the usual CRC, can we be sure that
the frame is 'clean' and therefore worth repeating.
This implies store-and-forward at level 2, in other words a frame-level
(as opposed to a bit-level) repeater.
I suspect the FCC may take offence at any repeating of incomplete frames,
or those where the 'callsign' octets have been accidentally modified....
If you just regeneratively repeat at the bit level, without checking the
validity of the bits in their level-2 context, there is a strong possibility
that you will spend some significant time repeating garbage.
For example, your DCD or Statemachine may be triggered, so you start
repeating on the output frequency, then you get hit either by a
burst of intermod, or a 'hidden station' stamps on your repeater input

frequency. The smart repeater should detect this, and stop repeating; but it has already sent part of a frame (which it was repeating before the noise/intermod. appeared) on the output frequency; others see the repeater as having repeated an incomplete, junk frame.
The extent to which this is harmful depends on several factors, some of which are:-

 (1) Synchronisation time of the modems.
 (2) TX/RX changeover time (turnround time) of the radios
 (3) Typical duration of a single frame.
 (4) Ratio of (1+2) to (3)

The only case where i can see a legitimate use for bit-level repeaters is where there is nobody else using the frequencies, both the repeater and the stations it links are using highly-directional beam antennas, and the link shows a very low error rate..
An example would be to link two adjacent valleys, on a dedicated frequency.
In other cases, it seems to me that frame-level repeaters are the preferred solution.

mark@ve6mgs.uucp (Mark G. Salyzyn VE6MGS) shows his ignorance:
>Don't tell me that you can hear when you are doubling with someone on the
>voice repeater.

Of course I can. I'm running a Motorola Micor in my car, and it simultaneously receives the repeater's output while I'm transmitting on the repeater's input. It runs 50 watts out, was built 15 years ago, and I paid $150 for it. Lots of them at the swapmeets for $50 these days.

Oh, you've got one of those Japanese ham-grade radios? Well, you have only yourself to blame for buying sub-standard equipment.

Wasn't it Rush that had a song about how all the trees were kept equal
by axe and chainsaw?

Anyway, that's all irrelevant. In another message, I explained why a
"bent pipe" repeater was a big win for packet operation even when the
users aren't duplex. Please take a moment to read and understand it.

No, since the repeater identifies itself adequately, its transmitter is
identified within legal requirements. The transmitting station has
identified its transmissions. There is no requirement that a voice
station's voice ID has to be repeated in order to be legal; it need only
have been made properly on the signal emanating from the originating
station. The repeater is responsible for identifying itself.

>a strong possibility
>that you will spend some significant time repeating garbage.

Certainly. However, voice repeaters often repeat undecipherable weak
signals too. Since it's to no one's advantage for it to continue to do
so, either the originating station fixes his problems or he goes away.

>The only case where i can see a legitimate use for bit-level
>repeaters is where there is nobody else using the frequencies, both

I suspect most people using the repeater will be able to present it with
signals that have a low error rate, even when repeated. At least, they
have so far in our tests.

>In other cases, it seems to me that frame-level repeaters are the preferred

>solution.

If you have a frame-level repeater and uncontrolled access, you must transmit
a busy-tone whenever a candidate frame is being received (unless you're
already transmitting a previously-received frame), or else you've just
earned back the hidden-station problem. And having the repeater be a
frame-level device is the same as adding one digipeater delay into every
connection. I don't think frame-level repeating is much of a win.

This is just plain nonsense. You don't need full dux in CSMA. Only
in CSMA/CD is it required.

You get significant advantage because your carrier detect signal hears
stations that start before you transmit, reducing collisions. Also,
regeneration will reduce the error (and hence retransmission) rate
because people who might be on the channel with weak signals simplex will
have better signals through the repeater in most cases.

OK. Now I think we all agree. What I think caused some of the confusion is
the concept of "full duplex" as oppoesd to "half duplex". I will agree that
the hidden transmitter problem is reduced but definitely not eliminated. After
all, I am sure we have all heard a double on a voice repeater. And in that case
we are not talking about 200 msec response times. :-)
I personally would like to see CSMA/CD implemented, but it probably isn't coming
soon.
So, lets get practical. I have a couple of DR-200s friom PACCOMM. What is the
likelyhood that I could throw together the necessary software to make one of these
receive on one channel and immediately retransmit the bits on the other channel
thus providing a cheap, regenerating, full-duplex repeater??
I'm probably going to give it a try one way or the other as the only other choice
for these boxes is ROSE and I don't see a lot of interest in doing that.

Basicly, I plan to look at making it take the bits exactly as it receives them
stuff them out the other port.
Any comments??

All the best.

What is the approximate price class the PackeTen cards will fall?

  Surely breaks down? We're talking about duplex data repeaters.
They work just like voice repeaters. There's really no difference.
They eliminate the hidden transmitter problem, dramatically reducing
the chance of collision between stations.

>Only by receiving the *whole* of a frame (assuming we are using
>HDLC and AX25) and performing the usual CRC, can we be sure that
>the frame is 'clean' and therefore worth repeating.

  Repeat 'em all and let God sort 'em out.

>I suspect the FCC may take offence at any repeating of incomplete frames,

>or those where the 'callsign' octets have been accidentally modified....
>If you just regeneratively repeat at the bit level, without checking the
>validity of the bits in their level-2 context, there is a strong possibility
>that you will spend some significant time repeating garbage.

    The FCC has never had a problem with people that are only 10%
readable on a voice repeater; why should they start worrying about
data frames which are noisy on packet?

>For example, your DCD or Statemachine may be triggered, so you start
>repeating on the output frequency, then you get hit either by a
>burst of intermod, or a 'hidden station' stamps on your repeater input
>frequency.

   For all practical purposes, you won't ever have hidden stations
on a duplex data repeater. Certainly it is possible, but not likely.

> The smart repeater should detect this, and stop repeating; but
>it has already sent part of a frame (which it was repeating before the
>noise/intermod. appeared) on the output frequency; others see the
>repeater as having repeated an incomplete, junk frame.

  Why is this a problem?

>The extent to which this is harmful depends on several factors, some
>of which are:-
>
> (1) Synchronisation time of the modems.
> (2) TX/RX changeover time (turnround time) of the radios
> (3) Typical duration of a single frame.
> (4) Ratio of (1+2) to (3)

  Why are any of these considerations with respect to corrupt data
frames? I don't see your point.

  Brush up on how duplex data repeaters work. Send me a SASE and
I'll send you copies of the ARRL Computer Networking Conference
papers on this subject (This offer is open to all). You'll see
that your concerns are moot.

IMHO, repeating garbage packets with incomplete callsigns is not a legal problem as long as the repeater IDs *itself*. The individual repeated packets are not IDing the repeater, they presumably were IDing the original station.

> If you just regeneratively repeat at the bit level, without checking the
> validity of the bits in their level-2 context, there is a strong possibility
> that you will spend some significant time repeating garbage.

This could be true but what else would you be doing with that time? Your reciever is busy recieving the garbage and not doing useful work anyway. If this becomes a problems then it is a problem that the originating station needs to work out and is a network management problem and not anything wrong with the use of a repeater.

> For example, your DCD or Statemachine may be triggered, so you start
> repeating on the output frequency, then you get hit either by a
> burst of intermod, or a 'hidden station' stamps on your repeater input
> frequency. The smart repeater should detect this, and stop repeating; but

As I believe, there is not legal reason to stop repeating and no technical reason either since the transmitting station will continue to send. Unless it is also full duplex and includes collision detection. In that case it stops itself and no "smarts" are needed by the repeater.

> The only case where i can see a legitimate use for bit-level

repeaters is where there is nobody else using the frequencies, both the repeater and the stations it links are using highly-directional beam antennas, and the link shows a very low error rate..

The legitimate use I see is to eliminate hidden transmitters and provide a little better turnaround time over store and forward digipeaters. Since the repeater is a fixed location and all the users are presumably fixed, beam antennas are a very good idea to boost link margins and promote re-use of the repeater pair.

> And in that case >we are not talking about 200 msec response times. :-)

The hidden transmitter problem is eliminated. Completely. 100%. Every receiver on the duplex machine can hear every other transmitter. 100%. However, you are right that there will still be collisions. The collisions will *not* be due to hidden transmitter syndrome, though. The collisions are due to the delay from the time a station starts transmitting to the time another station starts receiving. This delay is the combination

of transmitter keyup delay, propagation delay to and from the repeater, and receiver DCD response time. The propagation delays are short, suppose the repeater is 40 miles away, the delay due to propagation is around 200 uS. The receiver DCD response, if using a good circuit like a state machine, will be less than, say, 16 bit times, or 13 mS at 1200 baud. The transmitter keyup delay is the most important. Most synthesized radios require 150+ mS to start transmitting from the time PTT is activated.

  On a voice repeater, the 150+ mS delay is enough to lead to voice collisions. On a data repeater, the same is true.

  How is the likelihood of a collision reduced on a duplex machine?

  A couple of ways. First of all, *stop using slow PLL radios for packet*. Use a crystal controlled radio for packet. They switch much, much faster, and introduce much less phase induced noise in your signal. They're cheaper, too. Crystal controlled radios are plentiful and cheap at swap meets. It simply doesn't make sense to take an 800+ channel PLL synthesized radio and dedicate it to one packet channel. Take a crystal radio and buy one pair of crystals and be done with it. The faster TX Delay reduces the chance of collision and increases your throughput.

  The next way to reduce collisions is to introduce a random delay after the channel clear before transmitting. This delay should be long enough to allow a transmitter to become audible. Persistance is a little better; every transmitter rolls a die and decides whether to wait or to transmit right away. Ideally, the probability of each transmitter deciding to transmit should be about 1/n, where n is the number of transmitters competing for the channel at once.

> So, lets get practical. I have a couple of DR-200s friom PACCOMM.

> the other as the only other choice for these boxes is ROSE and I don't
> see a lot of interest in doing that.

  If you are going to run the transmitter and receiver at the same time, you need to make certain to provide sufficient isolation between them. You can either use separate antennas a good distance apart, separate frequencies a good distance apart (like a factor of 2 or more), or a single antenna with a duplexer. Look in the ARRL Handbook in the section on FM repeaters for more information on setting up a duplex repeater.

Sure, but the clarification doesn't really apply (see below).

>There will still be cases of systems the repeater cannot hear but that can
>& will be heard by stations in the repeater's area. Packet frequency usage
>and siting would have to coordinated a whole lot more than it is now to
>completely eliminate the possibility.

But the user's of the system aren't listening on the repeater's input: they are listening on the output. Therefore, the system's users will *never* hear any station directly.

Coordination is a problem. However, it is not an insurmountable one: it has been done for voice repeaters, why can't it be done for data repeaters?

While I agree wholeheartedly with the arguments for duplex repeaters, the
above statement is a bit optimistic. What (I think) you mean is that:
"Every receiver on the duplex machine {i.e. those that can hear the
repeater} can hear every other transmitter THAT THE REPEATER CAN HEAR."

There will still be cases of systems the repeater cannot hear but that can
& will be heard by stations in the repeater's area. Packet frequency usage
and siting would have to coordinated a whole lot more than it is now to
completely eliminate the possibility.

On a side issue, can anyone tell me if the Ramsey 2m kits can readily be
set up for duplex operation?

Cheers,

I recently bought a PK88 and am trying to decide the best way to wire
it to my Icom W2A. I would like to be able to receive/transmit packet on one
band, with the option of listening to my favorite voice repeater on the
other.
Has anyone done this? (that's a silly question, there always is at least
someone on here that has done EVERYTHING!)

Any help would be appreciated. I can't seem to find anyone in my area with
a W2A.

Thanks!

Gee, it's not very nice to operate simplex on the input to a repeater,
whether that repeater be voice or packet. Even inverse duplex on a
repeater's frequencies tends to tick people off. This is basically the
only way that interference of this kind would occur. Unless, of course
the local coordinating body allocated the same repeater pair to two
packet repeaters that are too close to each other... But then, the
same rules that are used to coordinate voice duplex repeaters should
be used to coordinate packet duplex repeaters. Especially since they
tend to share the same frequency bands.

Couldn't one just take an existing underused voice repeater and convert it
to a data repeater? Coordination is already done (unless the requirements
of a data machine are much different than voice). Would a data machine and
a voice machine in the next county live with each other on the same frequency?
I could see it happen that we would get a random distribution of voice and
data machines in the repeater subbands, the data machines being converted
voice machines. (people have mentioned that there is an overabundance
of voice machines around)

Usually dual banders have slow PTT switch response because of its PLL
complexity. And you can't transmit simultaneously on two (or more)
bands. I do not recommend dual (or more) banders for a permanent
packet radio operation.

We've tried with and without bit regeneration on our full duplex repeater.
There doesn't appear to be any advantage to using the regenerator except
to keep voice users off. If the signal is good enough to be decoded at
the repeater, it's good enough to be decoded after being repeated, if
your repeater is any good. We're using regeneration now, but strictly
as a anti-voice measure. Theoretically it should help, but in practice
we haven't seen it.

BTW we probably have a claim as the first full time dedicated full
duplex data repeater. The KD4NC-1 146.13/73 machine has been full
time packet since the mid-80s. We've run AX25MON extensively on it
and on the other LAN in town which is simplex store and forward on
145.03. The duplex system consistently has better than double the
thruput of the simplex system. During peak activity it is *much*
better than double the capacity of the simplex system. All Grapes
LANs are linked by 56 kb trunks, or are in the process of being
linked. Users on 145.03 report better performance when connecting
through the switches to a user on the 146.13/73 system than when they
connect to another station directly on 145.03 using the switch as a digi.
The trunks are so lightly loaded that they are virtually contention
free. They have 49 times the capacity of a 1200 baud channel.

There are no hidden transmitters in a full duplex repeater system. Either you are in range and can use the system, in which case you hear everybody courtsey of the repeater, or you are out of range and can't use the system. Our LANs are laid out based on the 100% coverage curves of our repeaters. If you aren't in the coverage, you're supposed to be on another LAN.

>Only by receiving the *whole* of a frame (assuming we are using
>HDLC and AX25) and performing the usual CRC, can we be sure that
>the frame is 'clean' and therefore worth repeating.
>This implies store-and-forward at level 2, in other words a frame-level
>(as opposed to a bit-level) repeater.

The repeater repeats *in real time* everything it hears on it's input, just like a voice machine. Even if the frame winds up as garbage, it serves as a busy tone to keep anyone else from wasting time by attempting to transmit over it.

>I suspect the FCC may take offence at any repeating of incomplete frames,
>or those where the 'callsign' octets have been accidentally modified....

The FCC cares as little about this as it does about a mobile voice user who is chopping in and out of a voice repeater. The responsibility of identification lies with each individual transmitter. The repeater IDs every 10 minutes. It's up to other stations to ID themselves on the frequency on which they are transmitting.

>If you just regeneratively repeat at the bit level, without checking the
>validity of the bits in their level-2 context, there is a strong possibility
>that you will spend some significant time repeating garbage.

Since the garbage is being repeated *in real time*, no usable channel time is lost. The garbage merely acts as a busy tone to notify other channel users not to waste their time transmitting until the input frequency of the repeater is clear.

>For example, your DCD or Statemachine may be triggered, so you start
>repeating on the output frequency, then you get hit either by a
>burst of intermod, or a 'hidden station' stamps on your repeater input
>frequency. The smart repeater should detect this, and stop repeating; but

>it has already sent part of a frame (which it was repeating before the
>noise/intermod. appeared) on the output frequency; others see the
>repeater as having repeated an incomplete, junk frame.

See above, the "junk" acts as a busy tone preventing another user from
attempting a packet that will be trashed by the "hidden" transmitter
that would exist if you aborted repeating the bad frame. Without this
mechanism you are no better off than with a simplex system replete with
it's hidden transmitters.

>The extent to which this is harmful depends on several factors, some

>In other cases, it seems to me that frame-level repeaters are the preferred
>solution.

No. Frame level store and forward halves the effective baudrate of the
channel. *And* it offers no protection from hidden transmitters. It is a
clear loser when compared to direct repeating.

It can, and I recommend that you do NOT buy a radio until a manufacturer
or home brew'er starts building Full Duplex Radios NOW.

>So, lets get practical. I have a couple of DR-200s friom PACCOMM. What is
>the likelyhood that I could throw together the necessary software to make one
>of these receive on one channel and immediately retransmit the bits on the
>other channel thus providing a cheap, regenerating, full-duplex repeater??
Sorry, no software required AT ALL.

Make sure you talk to the local frequency co-ordinator to get a repeater pair.

Take your data radio and connect it appropriately to the Full Duplex 9600
(or 19.2K) modem (The K9?? modem is NOT Full Duplex). Wire the TXD to the
RXD on the modem. Use the CD to trigger the transmitter.

Get/build/beg/borrow/steal a set of Cans (Duplexers) for the data radio and
voila'.

There, a regenerative repeater. Ahhh, but you were talking node, that is
NOT a regenerative repeater and it creates the hidden transmitter problem
and requires software and maintenance costs.

A node could be formed using the NETROM/TheNet/ROSE software on regular
TNC feeding the Modem and Data Radio. No special bits, except `maybe' some
careful zipping up of the Z80 processor (Z-80H at 12MHZ? may be necessary).
But, I doubt it if the code is written carefully since there are KISS56K
EPROMs for the TNC-2s anyways.

Hope this helps ...

John Moore NJ7E sez:
>This is just plain nonsense. You don't need full dux in CSMA. Only
>in CSMA/CD is it required.

That is what I am arguing for. Dana and I have had a little e-mail discussion (or was it an argument :-) going about this (Dana:/CA or Me:/CD). I feel that if we design /CD into the system (Full duplex repeaters and Full duplex user sites) that the system will cost the same if done properly.

IF we go for the CSMA/CA model now, we have to trash it to get the /CD model, thus it will NEVER be done. However, the same considerations for a full duplex user site are made for a Half Duplex CSMA/CD site, saving on (what I feel to be) useless technology associated with CSMA/CA channels.

Now, you can all correct me if I am wrong, but if we press for the development of a dual band data radio (ie, 2W TC on 440, 220MHz RX) we solve the costs of the cans (duplexers) and I am sure it will cost the same as any single band data radio AND supplies us with FULL DUPLEX operation if we need it to boot. For the 56Kbps modem, a dual band transverter would be in order, this, unfortuneatly, would be more expensive than the simplex version (A chink in the armour :-{).

Now, if you use a dual band (ie 220MHx TX and 440MHz Rx) regenerative repeater, cheaper, since we do not need cans for it. The the single band repeater would require cans. We could run CSMA/CD with the dual band data radio with, I am sure, a simple mod to the KISS EPROM firmware.

Or, we could use these (dual band, user site, and repeater site) as the basis for a FULL DUPLEX site to site link. And, my imagination goes wild on what we could do if the Repeater was smart (rather than simply just regenerative) and run Half or Full duplex operation to the repeater (if it was a gateway) depending on what you need at that instant. My bwain hurst just thinking about all the `fun' things we could do with the channel.

Or, do you all want to buy single band split data radios and pay more in the long run. The choice is up to you (not me anymore, I bought a single band data radio already :-{) to do it right and stop thinking that CSMA/CD is not possible, or too expensive to set up. By buying single band data radios, you are all chipping this (useless CSMA/CA) technology in stone.

I know that the improvements going from Aloha to CSMA/CA are great, but going to CSMA/CD and FULL Duplex at a drop of a hat must be even a greater improvement at what I feel at this juncture to be the same cost if we could just get our collective minds together and `make the market'.

May the REAL DISCUSSION begin ... and thanks Dana for helping me think this problem through.

The problem is doing collision detection cheaply (or at all) at high data
rates (I think this discussion has come up before).

Collision detection is an *analog* process, done at the physical layer. So
for a system with CD, you not only need full duplex equipment, but you need
some CD circuitry. How complex is this circuitry?

Consider Ethernet: an Ethernet transceiver listens while transmitting with
the receive and transmit points at the same spot at the cable. To peform
CD, the transceiver just compares the transmit and receive data (ignoring
the insignificant time skew between the two signals).

However with the system you describe, the receiver hears what is transmitted
two link delays ago (the path out and the path back). For a 10km path, this
link delay is on the order of 70 uSec. At 1200 baud, this delay is is about
1/12th of a bit time. However, at 56kb the link delay is about 4 bit times.
So at 56kb, a CD system must compare what is being received now with what
was sent "about" 4 bits ago (where "about" depends on the total delay
of the system). As the speeds and link lengths increase, the problem
gets worse. With high enough data rates, long links, and short packets, it
is possible to have an entire packet in flight on the link and not be able

to do collision detection at all.

My point is that doing collision detection on a full duplex repeater/full
duplex user system is complex and costly. It doesn't sound worth the effort.

A clarification. *Baseband* ethernet systems {the 'traditional' ethernet}
detect collisions by a purely analog method --> the voltage level present
(dc averaged) is greater than 1 transmitter. No bit comparison is used.
Couldn't be used, since IEEE 802.3 requires collision detection even while
not transmitting.

The broadband (CATV) systems are more like packet thru a repeater.
In broadband systems, the collision detection can be done by the headend,
which recieves enough information to detect a collision and starts sending
an "extra" collision detection signal, or you can have individual stations

do bit by bit (easier is byte by byte) comparisons.

|>
|> My point is that doing collision detection on a full duplex repeater/full
|> duplex user system is complex and costly. It doesn't sound worth the effort.

It is more complex than not doing it; simulations and experience (on non
packet LANs) say you get a lot of bang for the buck.

|>

This should be fairly easy to do. The interface for the speaker and microphone is the same electricaly as the older Icom walkies. When you plug into the mic/sp1 connector, you have ground on the shell, speaker on the tip and mic on the ring. Use the hookup that the PK88 lists for the Icom walkies but make the connector for the W2 - you still have all three leads that the other walkies had.

To listen to the other band at the same time you will need to plug either an earphone or another speaker into the sp2 connector. Without this, the audio fo rthe second band will go to the PK88!

Hello,

I am new to amateur radio and would like to get invloved in packet. I have an Alinco 2m transiever and a old Z88 portable computer. Can anyone suggest a suitable, portable, TNC? What features should I be looking for?

Thanks,

Sean Clark,

>regenerating, full-duplex repeater??

Well,

1) You could cut the trace going into the modulator and hook up the
output from the demodulator if you wanted, but that would give you only
FSK regeneration - the bits wouldn't be retimed.

2) You could run them through basically a D-type flip-flop and clock it
at the derived baud rate, and that would regenerate the bit widths, but
not the timing.

3) You could clock the FF circuit from a baud rate generator and hope
that no one in your area has a baud clock that's far enough off to
cause problems, or add a bit FIFO and clock the bits in with the derived
received clock and out with the timed clock.

I use scheme (1) with a K9NG modem, which regenerates both 1200 and
9600. For $35 it's not bad; when the K9NG kit came without all the
useless parts and was $10 cheaper it was an even better deal.

No, all you have to do is keep hitting the idiot over the head until he
stops operating on the repeater's output frequency, and switches his
transmitter over to the input. Or run the repeater's delayed dropout
time up to half an hour or something so he'll notice.

Duh.

Greetings All,
  I have been wondering what radio is used by the European hams on 1296 for
their 9600 baud packet. Is this radio available in the US? What is the cost?
Is it a Kit or a plug-n-play. Is there a similar radio in Japan that can be
imported to the US market. I have seen it mentioned on a few occasions that
9600 is popular for the end-user in Japan. What radio do they use? Do they
have a 1.2GHz 9600 or higher radio in use there?
  I would like to get in touch with one or more of the European or Japanese Hams
that have access to information on 1.2GHz radios. I try to read this newsgroup
daily or you can respond to me directly at any of the following addresses.

Packet Radio User's Group (PRUG) members use V.29 FAX modems with
conventional 430/1200 (or 432/1296) FM transceivers. Some of our
members say the modem in 7200bps works much better than in 9600bps.
They use YAMAHA's chip. Some other people are using G3RUH modems.

PRUG has started an advanced development project for 64kbps TNC and
radio. A very simple TNC using HD64180 (a Hitachi's Z80 + SIO chip)
has already been ready by Masaaki Yonezawa, JE1WAZ. We're still
struggling on the radio part.

I am sorry but I don't know so much about technical details, but I can
forward your inquiries to the appropriate person. Please do not use my
Digital mailbox - send to kenji@komaba.c.u-tokyo.ac.jp.

Do the packet community a *real* favor; don't put up another digipeater.
Go the extra mile and put a real duplex data repeater. These work much,
much better, though may still need some linking to the standard digipeater
networks. The linking can be done at high speed, on UHF or so.

  A duplex packet repeater is a standard voice repeater with a modem
connected to regenerate the incoming data to the output, cleaning up the
signal and preventing irritating voice use of the data machine.

  If a sufficient number of people write me a private note, I'll post
details why duplex data repeaters are *so* much better than ugly digipeater
networks. (Note: even the AX.25 specification contains a paragraph
mentioning that digipeaters should be phased out).

With any packet TNC (at least all of those I have seen) connnected to a suitable FM tranceiver set on the approprieat packet frequency, set the TNC to "digipeat enabled". And there you have a Digital Packet Repeater. (I keep my personal packet station in this mode at all times. My coverage is so poor that I don't think that anyone uses it, but it is there if anyone wants to!

I think the original request was looking for a regenerative or pass-thru full duplex repeater and not a store and forward station. A digital repeater will recieve on one frequency and simultaneously transmit the bits on another. A voice repeater can pass the FM audio for 1200 or 4800 baud. For higher rates you can take the output of the digital demodulator and feed it back to the modulator, "regenerating" the data.

In addition to greater throughput a real repeater provides a peer-to-peer network capability and eliminates the dreaded "Hidden Transmitter Syndrome" completely.

Oh my, that's wrong. Very wrong. What is described is a digipeater. It's a store-and-forward packet regenerator; it's better than nothing but has no place in a modern network. Digipeaters do NOT have the ability to retry lost packets, and greatly reduce the bandwidth of any channel they're used on.

A digital repeater is more correctly described as being much like a voice repeater: it simultaneously receives and transmits on different frequencies and relays the digital signal through in real time. Some regenerate the FSK or AFSK signal and some regenerate the bits. Experiments have been conducted with packet regeneration and busy-tones.

The key difference is that packet communications over a digital repeater completely avoid the "hidden-terminal" problem, whereas the use of a digipeater practically guarantees you will have it.

I think that in most cases, a person proposing to install a digipeater should prove to himself that his installation will improve the network instead of degrade it. I suspect most people would be hard pressed to show that.

For those who don't know how a full-duplex packet repeater would work, here is a basic description.
You can modify and existing voice repeater by putting a modem for the data rate desired on the receiver. Then run the output of the demodulator side into the modulator side. Feed the output of the modulator into the transmitter. The modem will act as a data regenerator. Usually 2 modems will be used, one for receive and one for transmit.
The PTT line could be controlled by putting a state machine DCD on the demodulator output so that the repeater would only get keyed up on

a real data transmission at the data rate of the modem.

     I believe in the 10th ARRL Computer Networking Conference papers that there are articles about full-duplex repeaters for packet. Some of the other CNC's should also have info on them and how they solve a lot of hidden transmitter problems.

Not too long ago someone asked for info on where to obtain the FLEXNET boards. I havn't seen any responses back so I would like to ask the same info.

     Maybe a posting on some of the commands and what they do (I can't read the languages on them when I connect via gateway stations), and where boards, schematics and other information on them may be obtained.

     There is some interest in trying them out here but we need to get hold of a few of them first.

Although this is certainly true for digipeaters as they are currently
implemented in amateur radio, I do not believe that the concept of
single-frequency store-and-forward relaying is *inherently* flawed.

In particular, if automatic transmitter power control, collision
avoidance heuristics and clever routing algorithms were used,
a single-frequency network could be quite effective. Depending on
traffic patterns and network topology, it might even be more
spectrally efficient than the full duplex "bent pipe" repeater.

See my paper "Spectral Efficiency Considerations for Amateur Packet
Radio" in the most recent ARRL Computer Networking Conference for a
more detailed discussion. If you don't have a copy of the proceedings, you

Duplex Data Repeaters

In contrast to store-and-forward packet repeaters (digipeaters), duplex data repeaters are much like a standard duplex voice repeater. In fact, when operating an audio modulated packet mode, such as 1200 and 2400 baud, a standard voice machine may be used a data repeater. For non-audio modulation, such as K9NG/G3RUN 4800/9600/19.2k+ baud operation, a voice repeater will generally not provide sufficient bandwidth and introduce too much distortion for use.

A duplex data repeater consists of a receiver, a demodulator, a modulator, a transmitter, a duplexor (if the repeater uses a single antenna) and a control deck. The receiver, transmitter, duplexor and control deck are generall arranged in an identical fashion to a voice repeater. One may wish to replace the Carrier Operated Relay in a voice duplex repeater with a Coherent Data Carrier Detect Operated Relay. The demodulator demodulates the output of the receiver, and feeds the data to the modulator, which is connected the transmitter. This is often called a "data regenerator". Besides preventing voice use of the data repeater, the data regenerator "cleans" the signal and improves the overall data reliability between packet stations.

Store-and-forward digipeaters are generally limited to single data modulation and speed combinations. Duplex repeaters are generally also subject to this limitation; however, since the duplex repeater never decodes the data frames, it is possible to build a multiple format machine. Brian Kantor (brian@ucsd.edu) described such a machine in a posting to rec.radio.amateur.packet some time ago.

What are the advantages of a duplex machine? For those that actually understand the hidden and exposed transmitter syndromes, it is clear that a properly constructed duplex machine eliminates this problem entirely. The remaining issue is that of "jump-on", where a number of waiting nodes jump onto a frequency all at once after the channel becomes clear. Proper use of p-persistance can greatly improve this. A paper presented by Scott Avent, KK6HS at the 7th ARRL Computer Networking Conference, describes the significant throughput enhancement obtained using a duplex machine. Overall, I'll summarize in saying that a duplex repeater provides better throughput and real-time response to the users than two seperate simplex channels under the same loading conditions.

The duplex machine also allows one to distribute the network resources; since every node using the duplex machine has equal access to every other node, it is not necessary to locate a BBS or off-frequency gateway at the mountain top. Instead, a BBS or node linking to other frequencies can be located wherever it is convenient. A model which has great appeal is that

of duplex repeaters linked to each other using high speed point-to-point links.

  The drawbacks of a duplex data repeater are the same as for a voice repeater; the cost of the duplexor can be steep ($800 or so for a new one), acquiring a good mountain top site can be problematic, and getting a coordinated frequency pair from the local friendly frequency coordination council can make you feel violated and dirty. Considerations in selecting repeater hardware include excellent IMD immunity in the receiver, high data demodulator performance, no real-time delay is audio from receiver to transmitter, and fast transmitter key-up time.

  For the record, I agree entirely with Phil on this issue. However,
the problem is that we have installed base of AX.25 TNCs and users
of significant size. Naturally, there is no single correct way to
connect packet users together. Since the kind of revolutionary
technology Phil mentions is not common or particularly easy to build
(keep in mind many packeteers have trouble building the cable from the
radio to the TNC, how can they modify a modern FM radio for power
control?), it would currently be an attractive technology for linking
one duplex machine to another. Building a network which maximizes the
usefulness per dollar spent requires an open mind and using the
appropriate technology.

Old excuse, decision was made up here to move over to 70cm, set up a RAW IP

backbone with as many features as we could put in place. Reading RFCs and
any collision detection info that we can (Thanks to Lyndon/VE6BBM).
If you build it, they will come ...

It would help if we had a Internet noid being the president of the local A.R.C.

> Since the kind of revolutionary
>technology Phil mentions is not common or particularly easy to build

The confuser should look after most of it, the hardware is the least of
the worries. Sending out RTS and CTS packets require NO new hardware and
can make a big difference (theoretically) on hidden transmitter and
collision detection.

>(keep in mind many packeteers have trouble building the cable from the
>radio to the TNC, how can they modify a modern FM radio for power
>control?), it would currently be an attractive technology for linking

Forget power control, the cellular industry has it and it is never used
(at least in our area). If we get rid of the guys running 250W ERP into
a beam and all drop down to some reasonable power like 2-5W then we
wouldn't have many of the problems we have today. Of course, I am the
worse culprit with a 4dB Antenna and a 25W rig ... but I need it to get
out :-). The only advantage I see in power control is that the community
can shut the 250ERP stations down, rather than leaving it up to the
individual.

 *** Soapbox on ***
I have been fighting for the locals to start putting in that squelch busy
signal to the TNC so that they don't step on Intermod (they can't hear the
reply) or weak stations that may break the squelch but are not full quieting
enough to get the state machine DCD going. This alone will solve 90% of our
hidden transmitter problem, I know my station doesn't step on anybody
anymore for this simple hardware mod. However, NO ONE (except my close
friends and enemies) is biting since this mode is too complicated. The
only fix here is to do some software work and get something like the CTS
packet handshaking for channel usage.
 *** Soapbox off ***

  Err, the vast majority of packeteers use TNCs with EPROMs inside. Sure,
MACA (not the name of the bird) is a software change, but many people
don't want to take the cover off of the TNC. This isn't a reason not
to a evolve, it is only a (non-technical) hurdle that needs to be
overcome.

While many of the problems caused by single frequency store and forward
can be *mitigated* by clever protocols and careful physical network
layout, practical limitations make the "bent pipe" superior in many
cases.

Some of the problems with single frequency store and forward include
reduced thruput and increased system complexity. Store and forward
effectively cuts the channel baudrate in half for each hop even if there
are no collisions from hidden terminals. With bent pipes the effective
baud rate is not halved by repeating, hidden terminals are removed, and
system complexity is centralized in one communal resource.

In a service that has more unused bandwidth than money, use of bent
pipes is the most practical way to increase thruput. Careful physical
or spectral separation of data channels can increase total system
thruput, but the individuals paying the bills are interested mainly
in seeing *their* thruput improve. The bent pipe generally causes
a doubling or better of individual station thruput at the cost of
relatively small increases in complexity on the hill.

When we start talking about very large networks that can't be serviced
by single repeaters, then things change. Contention free, full duplex,
point to point trunks become necessary to maximize thruput. Store and
forward switching and routing become essential, and very high speed
channels become desirable.

Half duplex cellular channels are less desirable than full duplex cellular
channels because feedback is near instantaneous and hopping or power
control can become near continously adaptive. Use of half duplex store
and forward contention channels should be avoided wherever feasible.

All IMHO :-)

A repeater is far better for packet than operating one or more shared access simplex channels as Hidden Transmitter Syndrome is no longer an issue with the repeater. However, a decent alternative method is to have all stations set up with dedicated links to each other in some fashion such that no dependancies exist on nodes that get shut down. This is expensive compared to running a repeater but the performance and upgradability advantages are enormous.

My preference for network design would have all stations which operate as network points or as servers tied together via dedicated links and then have access for transient stations via repeaters on the cheapest band available in each area.

A while ago Larry Springsteen was asking here about 23 cm packet equipment in Japan and Europe. I tried to mail him this reply but the mail bounces back. I suppose there is general interest in 23 cm high-speed packet, so here she goes:

Hi Larry,

I suppose there are four breeds of hi-speed 23 cm packet radios used here:

1) The German 'Interlink' design

This is a very simple semiduplex radio built on one card. It has a fixed offset (35 MHz, I think). The Germans have lots of links built with it. We found the design to be techically somewhat mediocre and do no longer plan to use it.

2) The YT3MV design

The Croatians have had four 38400 bps nodes using this equipment. It is very simple, uses conventional parts like BFR96S, CA3089 etc. They are using direct manchester coded data modulation istead of FSK or RUH. The transmitter is true FM so you can use whatever modem you want to. See a recent issue of QEX for more details (the article was also posted here). Unfortunately the only construction article that is available is in Italian.

3) Basic transceivers

I have heard that some of the big buck organisatios use basic FM mobile rigs like the FT-912R or the IC-1200. In Helsinki they are going to use IC-12GATs at 1200 bps for short links.

4) Home made

Some people utilize designs originally made for ATV (see Radio Communications, the microwave, ATV, packet columns). Some people just make it from scrap, just like they do everything else...:-).

I have copies of the 1) and 2) articles. Some local chaps here at OH3TR are prototyping the YT3MV transceiver right now. If it works we are going to connect the local nodes ans bulletin boards together with such radios, maybe even build a link to the next town.

I have a copy of the original YT3MV article in an Italian magazine *CQ Elletronica'. If you are interested in the copies, please drop me a sae.

touche', write this off as me becoming real comfortable with my UNIX box
running packet :-).

However, I do beg to differ on this. In our city we have 97 active packeteers.
Of these, only ONE refused to do an upgrade. They all are EAGER to get (or
copy, for shame) whatever upgrade comes down the pike. The fearful amoungst us
always know (or try to know) someone who is brave enough to turn a couple of
screws.

I already feel left in the dust since many have already got the new upgrade
for their PK232s.

The REAL problem here, is that the system (The TNC and it's EPROM) is
a closed design. If I had access to the code, there is no telling what I
would do with it (If I could just figure a way of getting work to stop
interfering with the hobby :-). However, I sit, thumbs twiddling, waiting for
someone who has the code to experiment with the various protocol improvements
possible. Now, if the programmer were on the Net and did what Thomas Moultin
did, release the code to the massive parallel programmer USENET, then I am
sure lots could be accomplished.

Many of these protocol improvements can be tested out playing with NET/NOS,
but they do not see light of day if they are not published or implemented
in the TNCs ...

I hate to rain on your parade, but how many of these hams who "have trouble
building the cable from the radio to the TNC" are going to be able to set up
a full duplex packet station?? How many "out of the box" full duplex systems
have you seen?? For better or worse, the digipeater is here to stay for some
time to come. And it is still the most practical to set up if you intend to
maintain compatability with the installed user base.

I personally would like to try using packet thru a linear translator in order
to have full duplex operation. It works fine for Real Broadband LANS, and I
would like to see how it works over the air. But if there are no users with
equipment to take advantage of this type of operation, there is not much chance
of ever seeing it in operation.

All the best.

I don't expect to convince many hams to modify their radios for power
control. I *do* hope, however, to convince the manufacturers of
dedicated digital radios (e.g., the Kantronics 9600 bps radio modems
and the WA4DSY 56kb modem) to add the hardware hooks for power
control. An 8-bit D/A converter for setting the transmit power level
plus an 8-bit A/D for reading the receiver's agc is all I need.

At some point amateur packet radio will have to transition to
dedicated digital radios, as voice radios with 1200 baud audio modems
are just not designed for the job.

|> Forget power control, the cellular industry has it and it is never used
|> (at least in our area).

This may be true for most present FM systems, but it is certainly NOT
true for the next generation digital cellular system (Qualcomm's
CDMA). Continuous power control is absolutely essential to the proper
functioning of CDMA; all of the mobiles must be kept within a small
number of dB of each other at the cell site in order to maximize the
system capacity. Our mobiles do that in two ways: an "open loop"
component based on the received power level at the mobile (less
received power -> more transmit power) and a "closed loop" correction
component sent from the cell site to the mobile. The open loop
component does most of the work, and the closed loop component fine
tunes it.

Talking to the CDMA architects here at Qualcomm (and seeing it in
actual operation) has made me a BIG believer in transmitter power
control. The result is a system that is 10-30x as spectrally efficient
as ordinary, non-power-controlled FM. It really works!

It depends on your definition of "superior". I must admit that my personal definition is strongly biased towards maximizing spectral efficiency, i.e., designing a network that maximizes the total number of bits that can be moved per second across a given distance, using a given amount of spectrum in a given geographical area. The "bent pipe" has the problem that everyone's packets blanket the entire geographical area covered by the repeater, even if they are going to the station next door. They also use twice as much spectrum.

Yes and no. Again, the throughput must be normalized to the amount of spectrum being used, and the possibility that multiple non-interfering transmissions may occur simultaneously in different parts of the network can greatly increase the total carrying capacity of the network. Of course, for this to occur you need a) automatic transmitter power control, and b) a routing algorithm that minimizes NOT the number of hops taken to reach the destination, but the total number of receivers that have to be "captured" along the way. This means choosing a relatively long series of closely spaced, low power transmitters (each having a very small geographic coverage area) over a few high power transmitters (that blanket much more geographical area).

|> In a service that has more unused bandwidth than money, use of bent
|> pipes is the most practical way to increase thruput.

This may well be true. But at some point I think we should place some significant monetary value on spectral efficiency. The other services with which we compete for spectrum (e.g., cellular radio) certainly do. Indeed, Qualcomm wouldn't be in business developing CDMA if the cellular carriers could just go out and get all the additional spectrum they needed to expand their existing analog FM systems.

Don't get me wrong - I think there is plenty of room for parallel

approaches to improving amateur packet radio networks. The full duplex repeater is certainly an improvement, and it has the advantage of being relatively simple to understand. But I think the store-and-forward digipeater has gotten an unfair rap because of the broken way we've implemented it in amateur packet radio. Other packet radio networks, e.g., DARPA SURAN, have done a far better job and I think we can learn a lot from them.

  It sounds that the cellular telephone approach may be a way to start to approach the packet problem. Unless absolutely needed, a power level ought to be restricted to some small set amount (let's say 5 watts).

  As far as an algorithm goes, why not start something where the network nodes and user nodes can convey their Lat/Long. position. This may allow the network some smarts about best possible routing as a first level 'guess' for connections/thruput.

An e-mail response that I got from Pontus Hedman/VE3RPH rph@sq.com made it abundantly clear that I was not clear on a previous statement about using the Squelch busy signal. So, to reduce confusion, I would like to share with a paraphrase of my response to Pontus.

Pontus is using his squelch control to switch audio going to his TNC. The

TNC (a PK-232) does not have a State Machine DCD circuit and uses the fact that there is audio to determine if the channel is `busy'. I own an HK-232, a PK232 lookalike from the now defunct Heathkit Company, but have got my DCD State Machine mod done.

However, the squelch cutting the audio to the TNC creates a major problem. The requirement for a TXDELAY setting on average of 350ms to account for the receiver's slow squelch response. This is where the DCD State machine mod (Available from T.A.P.R.) comes in. It requires NO squelch at all to operate and detects signals that look like packets. In our area, everyone (who matters :-) has the DCD mod so we set our TXDELAY to 0 because of this. If you have a mixed base (DCD State machine is implemented in every TNC except AEA and KAM) then you have problems. You can ask any MFJ-1270 owner to run without squelch at all and it WILL work (with the following gripe).

However, this DCD state machine creates a problem. Intermod, accidental carriers and non-fullquieting packets are ignored. One can not receive packets if one is experiencing Intermod or accidental carriers, so why transmit? The weak signals ARE the hidden transmitters, so please do not transmit over them. And, we have found some people have set the AUDELAY setting, so a dead carrier is transmitted for the first part of the packet making life somewhat difficult. These people are using relay driven boat anchors and require it to not have spurs triggering the various repeaters in our area. We `may' end up transmiting over that as well since it is perceived to be `not a packet'.

Thus, we come full circle back to requiring the squelch signal.

Now, if we could all use the DCD mod to get back some bandwidth (TXDELAY=0) AND use the squelch to prevent transmission over Intermod/Weak packets then we will be almost home. This is what, as a minimum, all stations should implement in hardware. What a fight.

I have implemented a squelch following circuit that tries to adjust the squelch to a `break every 5-10 second when no signal rule' automatically as an enhancement on the above. Thus, I prevent my station from affecting many of the hidden transmitter. The only annoyance is that my station is dead if a station near by (Hi Fern :-) accidentally locks it's transmitters on, or someone using an HT for packet throws his HT between his car seats and produces a dead carrier ...

I would like to implement carrier control as well to make my station even friendlier, and that is my next project. Keep in mind, that a carrier 20dB down can cause a signal to not be full quieting (even though it has captured the receiver) thus destroying the packet's inteligibility. Now, if I could `just' use enough power, I will prevent my station from interfering with distant stations. If I had the code to the TNC, I would implement power control AND the MACA scheme of negotiating for channel to make one `trick' system.

Hope this helps you understand, Ciao, 73 de VE6MGS/Mark -sk-

As Robert Heinlein once said, "There ain't no such thing as a free lunch."
You've stated (or implied) that maximizing spectral efficiency is your
design goal. Well, transmitting data via the USmail is spectrally
efficient -- but there are certain performance limitations. Before I'd
sign up for a more spectrally efficient method, I'd like to see you
discuss the trade-offs in terms of protocol performance, equipment
complexity, required dynamic range, etc.

Cheers,
 Willis n5szf

  Hurrah for everyone who uses State Machine DCD! However, you probably can not all run TXDELAY 0. Why? Because the TXDelay actually is two different delays. One is the *receiver active delay*, the other is the *transmitter active delay*.

  Every transmitter, every single one, takes some time to become functional from the time PTT is asserted. For some of the synthesized radios, this can be quite long (the CPU in the radio has to program the PLL with the correct parameters for transmit, the PLL has to stabilize, then the transmitter is enabled). My Kenwood TR-2600A require something like 150 mS for the transmitter to become active. A crystal radio is probably most prone to crystal oscillator startup time, likely to be below 20 mS, though the audio amplifier chain may also have some large capacitors that need to charge up before real audio is available. Even if the receiver has 0 delay in recognizing the packet, the transmitter requires sometime before it can send valid data.

  The receiving delay accounts for the time it takes a radio to respond to a good signal. Most squelch circuits have some delay, and then most audio chains have some delay even after the squelch has decided the signal is good.

  So, TXDelay needs to account for both. Setting it to zero sounds suspect; I'd guess the TNC uses a non-precise granule, so you get some short delay, which means that sometimes packets will work and sometimes they won't.

>However, this DCD state machine creates a problem. Intermod, accidental

  The weak signals may be exposed transmitters; i.e., too far away
for you to jam, but strong enough to interfere with you. Anyway, the
TAPR State Machine asserts DCD on dead carriers (really). So, accidental
carriers and many kinds of intermod will assert DCD, so that problem is
not as pronounced.

>Thus, we come full circle back to requiring the squelch signal.
>Now, if we could all use the DCD mod to get back some bandwidth (TXDELAY=0)

  Which is why the TAPR State Machine has an input which can be used to
signify "channel busy" from the squelch line.

>use a voice repeater.

Ok, so we have Digipeaters, Nodes, Full duplex linear translators and
regenerative repeaters. Please do NOT forget that the latter two represent a

linking problem. It is NOT an easy job to link repeaters, but it is simple to link Nodes and Digipeaters on the same frequency. The only use for the full duplex systems are for point to point LAN situations, and they represent a problem once you start trying to set up a backbone ...

A regenerative repeater could be linked to another regenerative repeater, I am not debating that that is not possible, just that the costs of such a link far outstrip the costs of the system in place right now. Our club is making efforts to link Edmonton to Saskatoon, about 8 LONG UNRELIABLE hops as it stands ... we are having troubles getting money/equipment/time for half the trip, try setting up a set of regenerative repeaters with the increased cost of all the Cans, linking hardware and such and it soon becomes an impossible dream (Waaaahhhhh).

That's true, but thruput between individual stations beyond line of
sight is significantly better with bent pipes than with multi-hop
techniques that halve the effective baudrate at each step. Traffic
analysis around here indicates that the majority of station to station
communications occurs beyond the line of sight rather than neighbor
to neighbor. We must consider the actual desired traffic flows in
a system when deciding which technique best suits maximizing network
usability. Designing to solve the wrong problem can lead to a suboptimal
solution to user needs.

Amateur networks are unlike government networks in that the funding
and direction of the network comes from many competing individuals
each trying to maximize his success in communicating with a desired
target station. There is little central control or authority, the
user base is sparse and poorly connected, and resources are limited.
Techniques used in implementing the network must be responsive to this
or the system will fail to gain enough support from the user community
to be established and maintained.

Exponential backoff as originally implemented in your Net code is a good
technical solution to the problem of congestive channel collapse, but has
not been well received by many because it unacceptably reduces the thruput
of individual stations in a mixed competitive network that is not nearing

congestive collapse.

I applaud your research into solutions for densely populated, congestive collapse threatened networking systems, but that's not the major percieved problem facing amateur data communications. Simple connectivity and low individual thruput are the major perceived problems. Bent pipes immediately address both of these problems. Your solution requires a packing density seldom reached in amateur data networks.

Conceptually I like your proposals becuase they address the problem of system redundancy in the event of single node failure. The reality, however, is that single nodes are often the only link between groups of stations. The amateur network is sparse and resources to add multiple cell sites to close that gap are missing.

For the near term, concentrating on systems that address today's problems is more likely to be well received and implemented. Please continue your research, amateur networks may one day need them, but don't expect them to be widely implemented in today's networks or today's hardware. Meanwhile others will continue to attempt to address today's problems with solutions geared to meeting today's basic user population needs.

This subject has been well debated in the past. Primarily the problem with this approach is that network topology and geography aren't

closely coupled. Due to propagation and terrain, the best, sometimes
the only path between two stations may not be along the geodesic
connecting those stations. Having to first go North in order to route
South is a very common situation in packet radio.

Correct, I have my parameter AXDELAY set to 5 (50ms) since my transmitter uses
relays for the TX/RX, the crystals are running all the time (my mod) for
the receiver so that is a non-issue. My point was that the TXDELAY need not
account for the receiver delay anymore. I found that when I had TXDELAY
set rather than AXDELAY that I tripped various voice repeaters in the area.
Your mileage will vary, AXDELAY should NOT be used unless required.

My statement of 0 was for Dramatic effect (and wishfull thinking), A short
lie `sometimes' saves a load of explanation ...

> The weak signals may be exposed transmitters; i.e., too far away
>for you to jam, but strong enough to interfere with you. Anyway, the
>TAPR State Machine asserts DCD on dead carriers (really). So, accidental
A dead carrier exhibits NO packet behavior. However, the DCD state machine,
may be on or off depending on what state it was in just before the dead
carrier occurs. This is a BUG not a FEATURE and should not be relied upon.
I found this out when I played with disconnecting the mic signal, and later
confirmed this when a local's transmitter locked up because his station
supply (a set of 6 Volt Truck Batteries) dropped down while he was out
of town.

> Which is why the TAPR State Machine has an input which can be used to
>signify "channel busy" from the squelch line.
Do not forget, that ALL TNCs have a squelch busy line on their radio
connector. It is labelled RF-DCD on the MFJ-1270, MFJ-1274 and other
TNC-2 versions and SQ on the PK232. I do not know about the naming on
other TNCs, but it should be intuitive. Connecting directly to the State
Machine mod would be a waste of a good connector :-)

Anyways, the point of the post is all this discussion of power control, avante-garde repeaters and such seemed a waste since the user base is often reluctant to make their TNCs spectrally efficient, little lone bandwidth friendly (I could p*k* :-). The usual solution is to use the brute force approach (9600 - 56KBaud).

  What is so difficult about linking duplex data repeaters? You have a station somwhere (anywhere) in the coverage area that links to a back bone. Couldn't be easier. I'll reiterate the model I keep thinking of; duplex repeaters which cover user areas and are linked using high speed trunking. What is so difficult about that? It has the advantage of linking off-frequency, which can spread the load around better and, once again, eliminate hidden transmitter syndrome.

>complexity, required dynamic range, etc.

These are valid points. If it were easy to do, we'd be doing it already.
So there's no question that a power-controlled system would be more complex
than what we have now. But I don't think that's necessarily a disadvantage,
especially if much of the complexity can be placed in the software (which is
easy to replicate once it's written).

So the main issue is the cost/difficulty of the required hardware
support for power control (all else is in the protocol, which is
software). The receiver is easy; just put an A/D converter on the AGC
lead and use a lookup table to convert that to received power in dBm.

A quick back-of-the-envelope worst-case calculation says that you
might need as much as 128 dB of dynamic range in the transmitter; this
takes you from 100 watts (a fairly hefty transmitter on VHF/UHF) down
to a tenth of a nanowatt (about what's required to talk to your
next-door neighbor 30 feet away.) Now you may not need all this
dynamic range in any particular station -- you may not need 100 watts
to reach the furthest station in your network, and you only need to
reduce power to the level required to reach your nearest neighbor, who
may be much farther away than next door.

Getting this much dynamic range in a power-controlled transmitter will

probably take some work, but I don't think it should be insurmountable. You can probably get 20-30 dB of range by controlling the gain of the common PA "bricks", so you'll probably need to switch out entire stages, starting with the final, to get more attenuation than that. PIN diodes can probably do the trick. For example, you just shut off the power to the final and bypass it with PIN diodes. If you need more isolation, switch in some attenuator stages. You do have to make sure that the PIN diodes provide enough isolation to keep the final stage from feeding back when it is switched in and running at full gain.

Again, I don't expect the average ham to hack this into his radio, but I don't think that this should be beyond the abilities of a good radio designer either. No, the hardest part is going to be to convince the average ham that it really *IS* in his best interest to not always run the maximum power that his transmitter is capable of...

I don't see any problem here; you can link two regenerating, full-duplex repeaters quite easily by just setting up co-located user stations for the two repeaters and connecting the two user stations through a packet switch that routes between them. It's just like placing an IP router (or a bridge, for that matter) between two Ethernets.

     You can get a number of ham related mac files from
apple.com, Also ucsd and tomcat has a number of files as well.

I operate a gateway for USENET articles to the local Packet Bulletin Boards.
A side effect is that I am building a list of the amateurs on the Network. Here
is the list I've maintained. I would be pleased to take any e-mail updates to
this list. This list is now greater than 50K.

Enjoy, 73 de VE6MGS/Mark -sk-
---------------------------It's been a slice---------------------------------
Network address to name or call letters lookup table
#
Entries have this format:
Address   Call Name
#
Address Network address popularily used by individuals on the network.
Call   Call letters of the individual.
Name   Name of the individual. A trailing * denotes not searched in
call book for verification yet, @ means not found in call book.
? after name means recheck (Call does not match name or other
discrepancy) may be required. If there are none of these, then
the address/call and name have been confirmed in the callbook
(1987). Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid. Although the address that many
news posting software add may be incorrect, personnal e-mail
contacts or updates are always placed first in the list of
duplicate calls, and is considered the latest address.

This discussion of DCD problems just underscores something I've been saying
for the past several years: :-)

CSMA on simplex radio doesn't work!

The whole problem with any carrier detect circuit, EVEN ONE THAT IS
INSTANTANEOUS AND 100% RELIABLE at distinguishing real data from
noise, is that it doesn't really tell you what you want to know: would
I interfere with somebody if I were to transmit now? Not hearing
another signal on the channel doesn't guarantee that you won't
interfere with somebody if you transmit, and conversely hearing
another signal doesn't mean that you would necessarily interfere with
it if you DID transmit.

I think the secret to making simplex packet radio work is to use a
receiver-directed contention scheme. That is, you shouldn't care if

you hear a given transmitter; you want to know if you'll interfere
with that transmitter's intended receivers. That means you need a
protocol where the receiver, not the transmitter, holds off contending
transmitters. E.g., my "MACA" scheme, or the simplified version.

And the nice thing about such a scheme is that its all software; you can
get rid of your carrier detect circuits altogether.

Phil

>say 5 watts).

There's no fundamental reason to set an arbitrary limit on the
transmitter power, as long as only the actual amount of power required
is used for any given transmission. Of course, economics (and the 1Kw
FCC rule) will dicate SOME limit in any actual radio.

> As far as an algorithm goes, why not start something where the network
>nodes and user nodes can convey their Lat/Long. position. This may
>allow the network some smarts about best possible routing as a first
>level 'guess' for connections/thruput.

This has been discussed in the past. For many real-world topologies,
latitude/longitude figures bear only an extremely approximate relation
to optimal routing. It seems to me that a fully dynamic scheme that
makes decisions on what can actually be heard is needed anyway, and
that will pretty much supersede the lat/long info.

writes:
>That's true, but thruput between individual stations beyond line of
>sight is significantly better with bent pipes than with multi-hop
>techniques that halve the effective baudrate at each step.

I don't think this is true, especially if you normalize for the amount
of spectrum that's being used. If the stations aren't in
line-of-sight, then chances are they're fairly far apart
geographically, and that calls for a repeater that blankets a fairly
large metropolitan area. A series of relatively small
store-and-forward repeaters could cover the distance between the
stations without having to blanket the entire area covered by the big
repeater.

 Traffic
>analysis around here indicates that the majority of station to station

>to neighbor. We must consider the actual desired traffic flows in
>a system when deciding which technique best suits maximizing network
>usability. Designing to solve the wrong problem can lead to a suboptimal
>solution to user needs.

It would be interesting to look at your traffic statistics from a
broader perspective. Is all the traffic to or from a single node,
(e.g., a BBS or DX cluster?) If so, then a change in application
architecture is called for - users should send person-to-person

messages to each other directly, not through BBSes, and DX callouts and BBS bulletin traffic should be relayed either through high level relay stations running an efficient broadcast protocol - the one place where large, high-level transmitters make sense - or with an efficient store-and-forward neighbor-to-neighbor "flooding" scheme a la USENET. In this day and age, I have to admit that I have little sympathy for squandering spectrum to support "dumb terminal" users who can't be bothered to get the necessary local computing power and storage to do the job right.

>Amateur networks are unlike government networks in that the funding
>and direction of the network comes from many competing individuals
>each trying to maximize his success in communicating with a desired
>target station. There is little central control or authority, the
>user base is sparse and poorly connected, and resources are limited.
>Techniques used in implementing the network must be responsive to this
>or the system will fail to gain enough support from the user community
>to be established and maintained.

Exactly! That's why I'm such a fan of decentralized, self-organizing networks that avoid depending on specialized shared resources like hilltop repeaters. It's much easier to convince a user to buy something for himself than to contribute his fair share to a joint project. (AMSAT has had to deal with this fact for years.) That there are as many centralized service nodes on the air as there are speaks more to the dedication, generosity and egos (not necessarily meant pejoratively) of a few hams who are more willing than they ought to be to compensate for the laziness of the average ham.

>Exponential backoff as originally implemented in your Net code is a good
>technical solution to the problem of congestive channel collapse, but has
>not been well received by many because it unacceptably reduces the thruput
>of individual stations in a mixed competitive network that is not nearing
>congestive collapse.

There is a good solution to this problem, at least at the AX.25 level - the "blimit" (backoff limit) parameter. You set it to the maximum number of stations that can contend for the channel simultaneously. It then limits the exponential backoff to that degree. That prevents congestion collapse, and it also keeps the backoff from getting out of hand.

"Competitive" is the key word in what you said. There's enough competition already in ham radio, especially of the destructive kind that results in less for everybody. I'm not proud to be in a service where the lucky few who get through to the space shuttle on 2mFM have to run megawatts of EIRP to do it. I'm not proud to be an amateur packeteer when I listen to a packet channel running far below its capacity because of power levels that are 40-50 dB above where they need to be.

Somebody (I can't remember who) said that a civilization can be rated by the extent to which its members are willing to maximize the common good as opposed to maximizing their own individual good. By this

measure, ham radio isn't very civilized. Human nature being what it is, you can't expect much better given the primitive, manual nature of our technology and its requirement that users go out of their way to give the other guy a break. If you want things to get better, you have to automate them. And that's what I'm trying to do. I try to design my algorithms to produce GLOBAL optimums in network performance, and if somebody else doesn't like it, well, they have the source code and can hack it to their own liking.

>I applaud your research into solutions for densely populated, congestive
>collapse threatened networking systems, but that's not the major percieved
>problem facing amateur data communications. Simple connectivity and low
>individual thruput are the major perceived problems. Bent pipes immediately
>address both of these problems. Your solution requires a packing density
>seldom reached in amateur data networks.

Try visiting Southern California...

>Conceptually I like your proposals becuase they address the problem of
>system redundancy in the event of single node failure. The reality,
>however, is that single nodes are often the only link between groups
>of stations. The amateur network is sparse and resources to add multiple
>cell sites to close that gap are missing.

Again, visit here sometime. Actually, my goal is to devise an architecture that will work for ANY concentration of nodes. That's the nice thing about it - if your network is sparse, then stations will, on average, run more power and talk farther between hops because that maximizes the network capacity for that set of circumstances. But as you add nodes and the average internodal distance decreases, the average transmit power decreases, and the total network capacity in a given geographic area actually INCREASES due to the increased frequency reuse factor.

>For the near term, concentrating on systems that address today's problems
>is more likely to be well received and implemented. Please continue your
>research, amateur networks may one day need them, but don't expect them
>to be widely implemented in today's networks or today's hardware. Meanwhile
>others will continue to attempt to address today's problems with solutions
>geared to meeting today's basic user population needs.

Once again, I see our approaches as being more complementary than competitive. I think the more approaches that are pursued in parallel, the better; the greater the chance that one will fit a given network's needs. It is partly because I saw others working on the full duplex repeater (but no one working on fundamental changes to simplex relaying) that I decided to give the lowly digipeater another serious look.

Baycom is becoming quite popular in the United States. I don't run it
here but I do help others out and I tell people about the program all
the time.
     I have both versions 1.2 and 1.4 and in 1.2 there are some English
docs. Was wondering what differences there are between 1.2 and 1.4 and
are there any English docs available for 1.4 or at least the info for
the upgrade.
     Also what exactly is the latest version?

KAM versions 4.00 onwards do have a possibility of software DCD. I have had
4.00 since thursday and it seems to work remarkably better than the squelch
'DCD'.

German TNC2 clones by DK9SJ have an Exar 2211 DCD circuit. It works rather

well but it cannot distinguish audio bleeps from real data.

We have modified all our network TNCs to have the state machine and try to encourage all users to make the modification, too.

Hello!

Can anyone tell me where I might be able to FTP a copy of the 901111 version
of the Rose X.25 Networking software? I have 900703 but am looking for
901111 as I believe it has password protection on the node configuration
access.

Also I am interested in finding out more about a PC version of Rose.
A bulletin floated across my local BBS network a few weeks ago from France
regarding a version of Rose that had been ported to a IBM-PC platform
and I would be most interested to hear more about this, whats required
as far as TNC's or Plug in cards etc, whether the software is available
yet, where can it be obtained from etc

Any help would be great.

Thanks and Cheers de Grant VK5ZWI

Cost ... :-}

No, we are thinking of linking regenerative repeaters here (if we get any
up that is) using Raw IP backbone links. Some of these may even link
directly into Internet sites, providing some form of security filtering.

But, this all involves costs, and we have enough troubles convincing the
locals to fork over for AX.25 nodes. But, corporate donations are now being
sought to solve this problem ...

I think this is the basic sticking point. It's barely possible to
get *one* repeater funded, sited, and maintained in most areas. To
require numerous cell sites becomes financially and organizationally
impossible. Most of our communications is terrain limited rather than
power limited so power control doesn't enter in to the equation very
much at all. To require many little relay sites linking the folds
in the terrain is more complex and expensive than maintaining one
very high site that looks down into all the valleys. I understand
that this is a local problem and that in flat areas power control
would be helpful, as would directional antennas. In Atlanta we are
looking at 500 sometime users in 1800 square miles. At any given
time less than a hundred of those stations are powered up and less
than 30 are in use. They all want to be able to communicate with
each other in real time at some point.

>It would be interesting to look at your traffic statistics from a

>store-and-forward neighbor-to-neighbor "flooding" scheme a la USENET.
>In this day and age, I have to admit that I have little sympathy for
>squandering spectrum to support "dumb terminal" users who can't be
>bothered to get the necessary local computing power and storage to do
>the job right.

I agree with this 100%. We badly need to implement a broadcast protocol
and a flooding scheme. Both would ease the burden on the network
caused by users reading the same bulletins one after the other. That
probably is an accurate representation of traffic on our low speed
links. On the high speed links the majority of the traffic is station
to station mail and file transfers. There is a major difference between
the users on the two systems, however. Our high speed users tend to be
24 hour a day stations while our low speed users only appear at random
times and use their equipment for other things when not actively on
packet. This makes a broadcast protocol hard to sell.

>Exactly! That's why I'm such a fan of decentralized, self-organizing
>networks that avoid depending on specialized shared resources like
>hilltop repeaters. It's much easier to convince a user to buy
>something for himself than to contribute his fair share to a joint

>there are as many centralized service nodes on the air as there are
>speaks more to the dedication, generosity and egos (not necessarily
>meant pejoratively) of a few hams who are more willing than they ought
>to be to compensate for the laziness of the average ham.

While I don't disagree with the spirit of what you say, I must repeat
that many of our users are terrain limited (and apartment bound).
That means they have no connectivity at all without outside aid.
It's easier to sell *one* community resource than many, and infinitely
easier for a very small group of dedicated volunteers to *maintain*
one site than many. Our most scarce resource is people.

>There is a good solution to this problem, at least at the AX.25 level -
>the "blimit" (backoff limit) parameter. You set it to the maximum number
>of stations that can contend for the channel simultaneously. It then
>limits the exponential backoff to that degree. That prevents congestion
>collapse, and it also keeps the backoff from getting out of hand.

Yes, I know, and I appreciate it. What I was referring to was the
necessity to *add* that parameter to the original scheme. Sometimes
real world constraints break otherwise brilliant solutions to problems.
If level one were ethernet grade instead of being lossey and mixed

with stations who don't back off, the fix wouldn't have been necessary. But they are and it was because some things were beyond our limited control. Designing for the real world I call it.

>"Competitive" is the key word in what you said. There's enough
>competition already in ham radio, especially of the destructive kind
>that results in less for everybody. I'm not proud to be in a service
>where the lucky few who get through to the space shuttle on 2mFM have
>to run megawatts of EIRP to do it. I'm not proud to be an amateur
>packeteer when I listen to a packet channel running far below its
>capacity because of power levels that are 40-50 dB above where they
>need to be.

I understand. I appreciate why you are working to add spatial diversity to time diversity in packet radio. Bent pipes are an attempt to maximize the effectiveness of time diversity, which is poorly done on simplex store and forward because of hidden and exposed terminals. By not halving the effective baudrate, it makes up for it's use of two channels. In your proposal, spatial diversity through power control minimizes the hidden and exposed terminal problems. But every additional hop halves the effective baudrate, and power control doesn't address the problem of terrain blocking, thus making any connectivity at all a problem for many stations.

>Once again, I see our approaches as being more complementary than
>competitive. I think the more approaches that are pursued in
>parallel, the better; the greater the chance that one will fit a given
>network's needs. It is partly because I saw others working on the full
>duplex repeater (but no one working on fundamental changes to simplex
>relaying) that I decided to give the lowly digipeater another serious
>look.

I agree, and don't let my comments act as a damper on your approach. I hope that you do consider that a cellular approach *does* require more 24 hour stations positioned at strategic locations to adequately provide service for all. And that somebody has to *maintain* those stations and pay the power bills and site rental. There never seems to be a ham living where you desperately need a relay.

A set of general questions :-).

I am looking for recommendations on KISS-capable 9600+ BAUD TNCs (internal or
outboard) that can work with unmodified stock VHF/UHF radios. Also, how
inter-operable are the different types of high-speed modems/TNCs? If there is
no such thing as a high-speed TNC that can work with most existing radios,
does anyone have recommendations on radios that are EASILY modified or already
designed to work with these new high-speed TNCs?

To any amateurs in/around Perth, and also Faulklands ..
     Perhaps you would be kind enough to post the following on your local packet BBS s. It was sent to me by the local HOD in Physics.

     Anyone with an interest, and willing to be involved please contact me
     Stephen Pearce,
     psyxsgp@otago.ac.nz
     ph 64-3-4740-999 ext 8166, or 64-3-4763-778, or FAX 64-3-474-7611
     zl1any@dud.nzl.oc

or email dowden@otago.ac.nz directly.

     We are also looking for few other amateurs who may be willing to set up a phone relay around the time of the experiment to coordinate the monitoring stations.

Subj: Seeking a ham in WA.

Stephen,

Our ELBBO flights start in February. The data is down linked at 13.45 MHz to ground stations at Dunedin, South Pole, Durban and Brazil. There are gaps in this coverage so we will miss some data.

We need another ground station at or near Perth, W.A. Since 13.45 MHz is close to the 20 metre ham band, we are looking for an interested ham with a 20 m antenna (e.g., a steerable cubical quad). We will supply the receiver (Sangean), MSK decoder and logger (onto 5 inch floppies). Included would be a box with switch. In one position the ham's antenna would be switched to our

gear and in the other to the ham's. We would only want use of the ham's antenna when he/she is not using it. The floppy disk would last several days and takes a second to change it.

The floppies would be mailed back to us (at our expense, of course).

Another gap in our coverage could be filled by a ham in Stanley (Falkland Is) or far south Argentina. (The ELBBOs will track around the world at around 40 to 50 deg latitude).

Could you put this (or an edited version) on the Oz ham bulletin board if such exists? Alternatively, do you work 20m and so maybe know 20m hams in WA?

Regards,

Dick

1.7 Definitions: Commonly used terms in Amateur Packet Radio. 3

1.0 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small burst, or packets.

1.2 What is amateur radio?

Amateur Radio is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are

restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc.

1.3 Why packet over other digital modes:

Packet has one great advantage over other digital modes : automatic operation. Packet TNC's are very advanced as far as automatic control go. Just simply connect to the other station, type in your message, and it is sent automatically. Any packet TNC can be used a packet relay station, or a digipeater. This allows for greater range by stringing several stations in a row. On HF, this allows for contacts with stations normally not in propagation range.

Packet radio provides error free transmissions because of built in error detection schemes. If a packet is received, it will be correct.

Also, on VHF/UHF packet, packet operators are allowed to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBS's (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to simultaneously use the same frequency simultaneously.

1.4 What elements make up a packet station?

A TNC (Terminal Node Controller)
A TNC contains a modem to decode the audio signals into digital signals. It also contains a micro-computer handle to convert the digital signals into text that can be sent over a RS-232 port to the computer. The CPU also handles the protocol overhead of the packet station. When you send data, it takes the text, puts error checking on it (CRC) and also puts it in an envelope for sending. When receiving a signal, it takes it out of the envelope, and sends the message to the computer.

Computer or Terminal
This is the user interface. A computer running a terminal program or just a dumb terminal can be used. For computers, any phone modem communications program can be adapted for packet use or customized packet radio programs are available.

A radio

For 1200 baud operation (normal user access), a standard voice radio can be used. For UHF or VHF packet, Narrow band FM is used, normally on simplex channels. For HF packet, 300 baud data is used over single side band modulation.

1.5 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSCA/CD ?????? (Carrier Sense Collision Avoidance / Collision Detect) If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the radio keys up and the TNC sends it's packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet again.

1.6 What is AX.25 ?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified. AX.25 also included a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the senders and recipients amateur radio callsign, thus providing identification with every transmission.

1.7 Definitions: Commonly used terms in Amateur Packet Radio

HDLC : (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

AX.25 : Amateur X.25 protocol. The basis of most packet systems. See section 1.6.

TAPR : Tucson Amateur packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

digipeater : A packet radio station used for repeating packets.

See section 3.3.1 for more information.

digi : Short name for a digipeater

NET/ROM : A scheme for packet radio networking. See section 3.3.3 for more information.

TCP/IP : Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

KA9Q NOS : (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

NODE : A network node. Often a network node running NET/ROM.

KA-Node : A simple networking scheme developed by Kantronics. See section 3.3.2 for more info.

CSCA/CD ???? : Carrier Sense Collision Avoidance / Collision Detect.

TNC : Terminal Node Controller. See section 1.4 for more information.

AMPR : An abbreviation for Amateur Packet Radio.

44 net : The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format of 44.xxx.xxx.xxx.

ampr.org : The organization recognized on Internet for amateur packet radio TCP/IP.

2.0 Computing Network Resources for Amateur Packet radio . . . 1
2.1 What Newsgroups/mailing lists are available?. 1
2.2 What anonymous FTP sites are available 2
2.3 Are there any gateways for mail or news 2

2.0 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, subscribe to the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name for subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup):
General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup):
General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup):
Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with polices of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup):
General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (listserv group):
A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (listserv group):
A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

hs-modem@wb3ffv.ampr.org (mailing list):
Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (mailing list):
Group discussion technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (mailing list):
Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

For all lists at ucsd.edu, archives are kept of the discussions and maybe access via anonymous FTP to ucsd.edu. Some listserv groups also have archives. Send to the group's listserv 'help' for more information on commands. Digests for the ucsd.edu

discussions are available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

2.2 What anonymous FTP sites are available for getting packet radio information and programs:

This is not an inclusive list of FTP sites, but these sites carry a large portion of the programs available. Consult the Archie archive server for info on particular files. Send mail to archie@cs.mcgill.edu with the line 'help' for more information on archie file searches.

ucsd.edu : Primary distribution site of KA9Q's TCP/IP packages. Also, general packet radio information.

simtel20.army.mil: very large collection of amateur radio software.

wuarchive.wustl.edu: Mirror site of Simtel20 archives. Easier to use then the simtel20 archive.

2.3 Are there any gateways for mail or news between internet and amateur packet radio?

Currently, there is no general use gateways between packet radio or any other computer network. The primary problem with such gateways is required content of amateur packet radio. Most wire based networks do not have any rules on content (such as profanity or business) like amateur radio does. Therefore, all traffic destinated to amateur radio has to be hand filtered.

However, there are several experimental wormholes that are being tested through Internet. See the discussion on the gateways discussion group for more information.

        3.3.2 KA-Nodes 2
        3.3.3 NET/ROM. 2
        3.3.4 ROSE 3

3.0 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix System V, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

3.3.0 What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

3.3.1 Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if it's call was in the digipeater field, it would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting

any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

3.3.2 KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections because acknowledgments only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

3.3.3 NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM as if connecting to any other packet station. From there, he can issue the NET/ROM commands to instruct it to connect to another user locally or connect to another NET/ROM. This connect then connect again means that to a user's TNC, you are connected to a local station only and it's transmissions does not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM don't use all of the AX.25 protocol. Instead, they use special AX.25 packet called Unnumbered Information (UI) packets and then put their own special protocol on top of AX.25. This is again used to increase efficiency of it's transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network, but if band conditions such as ducting occur, often unreachable nodes are entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route

to a distant node manually defining each hop instead of using the
automatic routing feature.

3.3.4 ROSE

Rose is another networking protocol derived from X.25. Rose
nodes have a static list of the nodes it can reach. For a user
to use a ROSE switch, he issues a connect with the destination
station and in the digipeater field places the call of the local
rose switch and the distant rose switch the destination station
can hear. Other then that, the network is completely transparent
to the user.

The static routing tables ROSE uses ensures that packet routing
does not use unreliable links such as NET/ROM suffers from.
However, ROSE suffers from it's inability to change it's routing
table as new nodes come on line. The operator must manually
change every routing table, thus ROSE networks require greater
maintenance times.

Thanks for those who have made comments on my last version of the
standard packet connector. Here is the next update to the idea.

Standard packet connector:
pin 1 - 1200 baud pin (like normal radio's mike port)
pin 2 - 1200 GND
pin 3 - 1200 baud receiver audio (like speaker jack)
pin 4 - 1200 baud receiver audio GND
pin 5 - 9600 baud pin (direct to radio's mixer)
pin 6 - 9600 GND
pin 7 - 9600 baud receive audio
pin 8 - 9600 baud receive audio GND
pin 9 - FSK modem connection (+/- 5V mark/space)
pin 10 - FSK ground
pin 11 - FSK receive

pin 12 - FSK receive ground
pin 13 - TX (ground to key radio)
pin 14 - squelch open (+5v squelch open)
pin 15 - TX/squelch ground

Comments:

 o Shielded cables and connectors seem important. Twisted pairs
   between the signals and thier respective grounds would cut down
   RFI problems.

 o There may many grounds here. Are all the grounds needed or
   am I ground happy? :-)

 o A 15 pin D connector could handle all of these connections and I have
   seen some RFI shielded D connectors before, but they may have some
   impedance bumps at high frequencies. Any suggestions for a better
   connector? Some more pins would be nice for future additions.

 o Electrical isolation / lightning protection has not been included.
   This would be a valuable addition.

 o With a combination of this connector and a standard computer control
   connector (an extension to multi-drop KISS?), a computer controlled
   packet station could be just plug and play.

How about stressing the importance of filtering? They sell D connectors
with built-in filtering. Although these are quite expensive, they do
reduce greatly the amount of stray RF radiating through the TNC cables.

>
> o There may many grounds here. Are all the grounds needed or
>   am I ground happy? :-)

I believe you ground everything to the same ground. However, it is
neat to have a liberal amount of ground pins available if you deal
with separate shielded cables for every 'mode'.

How about the 37-pin size D with two 50-ohm SMB connectors for higher
speeds. Don't know if you can get those with RFI filtering, though.

>
> o Electrical isolation / lightning protection has not been included.
>   This would be a valuable addition.
>

How often do you usually install anything else than rotors and antennas

so that they nee lightning protection? You can install audio transformers
and optoisolators if the need arises, otherwise in my opinion it is
overkill to isolate everything any time.

> o With a combination of this connector and a standard computer control
>   connector (an extension to multi-drop KISS?), a computer controlled

>

Right. I have TNC's made to two different standards, at least three versions
of RS232 and a bunch of radios each having its own audio/ptt standard. I
have been QRT on packet for months since I haven't been able to make another
cable between my TNC and my new handheld (yes, the cable made for its
predecessor *does not fit*, of course).

BTW we here use widely the Kantronics 9-pin standard. It was adopted when
one of us had a KPC-II and the others who built their own made a decision
of some kind of standard. It is quite handy when you can use your own TNC
with somebody else's radio at a Field Day.

This is the last one of the summer.....

***** 50 cent buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
Sunday, October 20, 1991
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 400 sellers and free, off-street parking for >1000 cars!

Buyers admission is $1.50 (you get 50c off if you're lucky enough to have a copy of our add) and sellers spaces are $8.00-each at the gate or $5.00 if mailed by the preceding 5th. A sellers Season Pass for all 7 sundays is available for $28 if purchased by April 21st

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)

I think the audio levels should be specified too, and I don't like
the use of +5V signals .. the 'squelch open' should be an open
collector signal, like the PTT. It's also not clear whether you
mean '+5V when the squelch has opened' or '+5V to force the squelch
to open'. I suppose the former, since you'd probably use the 9600
baud pins if you can use unsquelched audio.
You should specify the maximum voltages that inputs like PTT are
pulled up to, and what the pulldown requirements are.

Specifying the pin usage by 1200baud / 9600baud seems irrelevant -
should be 'equalised&squelched' versus 'direct'.

I think you mean the FSK signals as digital i/o to an onboard modem -
in that case, they might be better as differential signals - RS423,
or whatever it's called now.

A power supply from the radio to the TNC would be useful, but perhaps
more trouble (what current limiting, what voltage, etc), than it's worth.

I would like to get started in amateur TCP/IP. I have got radios and TNCs and computer hardware, but no software. The machine I will be using is running SCO Xenix386 2.3. I do not have the SCO TCP/IP networking package as it is prohibitivly expensive. I have spoken to people who are running KA9Q's code on the amiga and with MS-DOS. Rather than trying to port one of those versions which were written for entirely different environment, I thought it would be best to start with some unix version of the code. I would appreciate any advice on getting the appropriate code to start from, so that I can minimize amount of hacking I have to do to get it to run under Xenix.

The approach you are taking may be a perfectly valid exercise for you,
but I suspect most of us simply can't be bothered to make all our gear
conform to some oddball (no flames, now :-)) standard using yet
another connector - and also one that probably isn't easily obtainable in
many areas. And why limit yourself to such slow speeds? At least, if you
used a DB-25 lots of us would have one, and you'd have room left over for
future expansion. I think you'll meet a lot of "why bother" resistance on
this one.

You may remember a previous posting of mine, on this weird TNC, and
some responded with hints etc. Well, I finally heard from Kantronics
themselves - it's a commercial version (as I thought) of their KPC-2400
(which I've never come across), and no - it does _not_ use AX.25 :-(

However, the good news appears to be that a simple EPROM swap is all
that is required, and the better news is that there is a dealer right
here in Oz - Stewarts Electronics. 'Course, he may not want to know
about upgrading something he never sold, but I'll try... He's also
better known as the local MFJ dealer.

By the way, Kantronics tell me the RFPM retails for US$500, so I hope
they don't make up the difference in the EPROM price :-)

One day I'll try and figure out just what protocol it does use, but
for now I'll obtain the KPC-2400 EPROM. Thanks to all who responded.

>we see all @WW/@WWW bulletins swapped to @ASIA (or @AS) bulletins.

Why? I see no reason to that other than there might be some users
who like to send 10 kb big bulletins in Dansih to @WW. But that too
can be prevented, I think.

>one (extend the existing one used in Europe)? I would seem to

That is what I would suggest! It seems pretty logic to me.

>So what should it be? Should we (sysops) change anything?

Stop swapping WW to asia or what ever, and use WW for World Wide, is
what I would suggest.

Sorry if this is a FAQ:

What kind of licensing is required for use packet radio?

What is required to get the license?

How long will it take to get the license?

I am new to this and want to get into it. I'm not sure where to start.
I currently have no radio experience.

Thanks for your help,

[The following are a couple of packet messages from the MDCBBS (Maryland-DC Section) packet network regarding ongoing plans to build a 900 Mhz backbone for packet in the Washington, DC area, to be expanded to Richmond and Philadelphia. Equipment will be surplus cellular-phone equipment modified to work in the 902-928 band with 9600 or 19.2K TNCs or radio modems running AX.25. Emphasis seems to be initially on practical, existing, off the shelf equipment and technologies to get something going, then once the idea proves viable from a reliability and propogation standpoint, migrating to more sophisticated techniques including higher baud rates and possibly TCP/IP. Again, the DC-area packet sysops seem to be (commendably) concentrating on positive action rather than blue-sky talk.

If you wish to become involved in such a project, or desire more information, contact one of the original packet posters below. I don't have any information beyond what I have already included in this message.]

MSG # TR SIZE TO FROM @BBS DATE TITLE
15479 B# 3069 NETWRK W3IWI MDCBBS 911015 Help needed on networking project
Forwarding path: W3IWI

Some of you may have followed the discussions over the past month -- several of us in MD, VA and PA are trying to build a real, high-speed packet backbone. I have suggested that the corridor from Richmond to Philly should be the first target.

We came into a windfall recently when we obtained over a hundred 900 MHz

radios that were surplussed from cellular telephone base stations in the Richmond area. The radios are all set up to be able to run 19.2 kb/sec digital data on point-to-point links.

The radios will require only minor modifications to work on the 902-928 MHz amateur band, but having suitable radios is but one necessary item. Here are some tasks that we need volunteers to assist on:

- Several small circuit boards to provide circuitry not in the celluar radios are needed. We need people with design experience to prototype and develop the widgets, someone to lay out the circuit boards, someone who has the ability to make circuit boards (probably double-sided, in quantities of 25 to 100 copies), and someone to undertake the task of building them up.

- The radios are useless without antennas. Most of them will be used on point-to-point links where some directivity and antenna gain is desired. Antennas might be ordinary yagis, loop yagis, cylindrical parabolids, etc. We need someone with a modest machine shop capability to take on the antenna building project. A shop equipped with a drill press, sheet metal shear, bandsaw and possibly a lathe would be ideal.

- We will be looking for suitable sites. We must remember that the real cellular systems have base stations operating just below the amateur band, and many of the new paging systems have STRONG! signals just above the band. My guess is that we will be better off with good (but not super) locations which don't have a lot of QRM. They probably should be 25-35 miles apart so that the point-to-point links have good, solid signals with no QSB. We will need people who know the area to look for suitable locations (perhaps at amateurs homes?) and to verify that the sites are QRM free.

- Some of these sites can just be dumb relay sites. But many will need to have high-speed multi-point digital switches so that the network can "feed" the users. The nature of the "data pump" we use to make these switches is not clear -- but the TNC2's used in most of the NetRom/ TheNet switches will be inadequate. We need to have a group of people who can either design the proper switch hardware&software or who will choose the commercial hardware that will be used.

Building a proper packet radio network that will meet our needs for the next several years won't be easy or cheap. We will need the support of all the area packet radio users to make it happen. Volunteers, please step forward. Comments are solicited.

73, Tom

*** END OF MSG # 15479 from W3IWI @ W3IWI.MD.USA.NOAM

MSG # TR SIZE TO   FROM   @BBS   DATE   TITLE
15523 B# 2457 NETWRK K3AKK MDCBBS 911015 The 900 MHz packet backbone
Forwarding path: W3IWI N4QQ
From: K3AKK@N4QQ.MD.USA

To: NETWRK@MDCBBS

The logical location for 900 mHz nodes is at the present node sites: PHL, SALEM (NJ), ELK, NAVY (or KENTI), DCA, PMILLS, KGEO, RICNDS. The 900 mHz nodes would replace the current 440/222/50/222 backbone. These sites are 30 to 35 miles apart and would have "crushing" signals at the 40 watt power level with gain antennas.

The technology that is immediately available is TNC2 with 9600 baud modems and AX.25. Some node sites have already upgraded to 19200 on their matrices and it should be standard. One should not discount the parallel processing power of the Z-80s in a node complex, with TNC communicating on the matrix with a handshaking protocol.

As better technology becomes available we can upgrade the network. We should not make immediate plans based on technology that isn't available now and complex software yet to be written.

It would be logical to have two 900 MHz nodes at the sites with one antenna pointed north and the other south. The 900 MHz nodes would interconnect with the other slower speed nodes at each site on a 19200 matrix.

There should be no access to the network at the network speed (9600) and, as AC4DS points out, the 900 network should be open to all packet flow. As he suggests, we COULD NOT expect amateur clubs and their members or, indeed, the general packet community to donate money and time to a network benefitting only BBS and closed to 1200 baud users on the present network.

The equipment requirements in the DCASC area of responsibility would be 8 radio transmitter/receivers, 8 TNC/9600 modems, 8 antennas and feedlines and expansion of the matrices at the four node sites. This equates to $700 to $800 per site not including the radios, purchased by DCASC, and now being modified.

PHL and SALEM to the north and KGEO and RICNDS to the south would be the responsibility of the neighboring jurisdictions.

This is what we could have in place by next spring. More elaborate schemes would take longer.

I can have K3AF-9:DCA900, with beam antenna and a 9600 TNC, ready to accept radio equipment for network testing within 4 weeks if this is the way we agree to do it.

73, Dick - K3AKK @ N4QQ NodeOp DCA nodes

program

BEAMCALC calculates the horizontal and vertical radiation patterns of horizontal dipole (lambda/2) antennas---with and without ground reflection.

Up to 64 dipoles with different X/Y/Z-coordinates, currents, and phases are possible.

It can help you to better understand how antennas work. You can even use it for the design of your personal antenna.

Required hardware: IBM PC with Hercules or EGA/VGA graphics card. 8087 is supported.

It is available at a low price: Only DM 89,-- (= 50 US $) + shipping cost.

Distribution on a 5 1/4" diskette (including many antennas) plus English manual.

I am fairly new to packet and need some help. I am having some strange things happen when I attempt to use my packet. It is a PAC-COMM 220 that was built up from a kit board. This is hooked up to my kenwood tm-321 running at 10 watts into a ringo ranger.

Anyway I can connect to some stations but not all stations that I can hear. I can connect to a node that is 30 miles from my house, but I can't connect to my neighbor that is 3 blocks away. I can connect to my neighbor that is 2 blocks away the other direction. One case I get a connect message, but then that is all I get and eventually I get a retries exceeded and it dumps me out. I can watch the meter on my radio and when my packet is sent out , I see an immediate response back from the neighbors TNC and the signal is at least 20b over. Another strange case I got during the SET was I connected to a node and his node said that I was connected, but I never was shown a connect message on my end. In addition, he was connected to my node and again I never heard any of the conversation that he sent.

Is there some parameters that seem obvious here that I should try.

First let me say thanks to Steve Schallehn for compiling this FAQ on
packet radio. I decided to put it into a LaTeX format to give the
document a typeset appearance upon printing. What follows, after the
cut here ----------, is the LaTeX code necessary to produce the
document.
                 Joe Retzer
                 (watch for callsign here)

\begin{center} {\Large{\bf Basic Packet Radio Information}} \end{center}

\noindent
{\large{\bf 1.1 What is packet radio?}}

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small burst, or packets.
\vspace{.25in}

\noindent
{\large{\bf 1.2 What is amateur radio?}}

Amateur Radio is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc.
\vspace{.25in}

\noindent
{\large{\bf 1.3 Why packet over other digital modes?}}

Packet has one great advantage over other digital modes : automatic operation. Packet TNC's are very advanced as far as automatic control go. Just simply connect to the other station, type in your message, and it is sent automatically. Any packet TNC can be used a packet relay station, or a digipeater. This allows for greater range by stringing several stations in a row. On HF, this allows for contacts with stations normally not in propagation range.

Packet radio provides error free transmissions because of built

in error detection schemes. If a packet is received, it will be correct.

Also, on VHF/UHF packet, packet operators are allowed to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBS's (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to simultaneously use the same frequency simultaneously.
\vspace{.25in}

\noindent
{\large{\bf 1.4 What elements make up a packet station?}}

\noindent
{\bf A TNC (Terminal Node Controller)}

A TNC contains a modem to decode the audio signals into digital signals. It also contains a micro-computer handle to convert the digital signals into text that can be sent over a RS-232 port to the computer. The CPU also handles the protocol overhead of the packet station. When you send data, it takes the text, puts error checking on it (CRC) and also puts it in an envelope for sending. When receiving a signal, it takes it out of the envelope, and sends the message to the computer.
\vspace{.2in}

\noindent
{\bf Computer or Terminal}

This is the user interface. A computer running a terminal program or just a dumb terminal can be used. For computers, any phone modem communications program can be adapted for packet use or customized packet radio programs are available.
\vspace{.2in}

\noindent
{\bf A Radio}

For 1200 baud operation (normal user access), a standard voice radio can be used. For UHF or VHF packet, Narrow band FM is used, normally on simplex channels. For HF packet, 300 baud data is used over single side band modulation.
\vspace{.25in}

\noindent
{\large{\bf 1.5 What do you mean we can all use the same channel?}}

Packet radio uses a protocol called AX.25. AX.25 specifies

channel access (ability to transmit on the channel) to be handled by CSCA/CD ?????? (Carrier Sense Collision Avoidance / Collision Detect) If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the radio keys up and the TNC sends it's packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet again.
\vspace{.25in}

\noindent
{\large{\bf 1.6 What is AX.25 ?}}

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified. AX.25 also included a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the senders and recipients amateur radio callsign, thus providing identification with every transmission.
\vspace{.25in}

\noindent
{\large{\bf 1.7 Definitions: Commonly used terms in Amateur Packet Radio}}

\begin{itemize}
\item \underline{{\bf 44 net}} The class A network designator
      for TCP/IP amateur packet
      radio. All numerical TCP/IP addresses are in the format of
      44.xxx.xxx.xxx.
\item \underline{{\bf AMPR}} An abbreviation for Amateur Packet Radio.
\item \underline{{\bf ampr.org}} The organization recognized
      on Internet for amateur
      packet radio TCP/IP.
\item \underline{{\bf AX.25}} Amateur X.25 protocol.
      The basis of most packet systems.
      See section 1.6.
\item \underline{{\bf CSCA/CD ????}} Carrier Sense
      Collision Avoidance / Collision
      Detect.
\item \underline{{\bf digipeater}} A packet radio station
      used for repeating packets.
      See section 3.3.1 for more information.
\item \underline{{\bf digi}} Short name for a digipeater
\item \underline{{\bf HDLC}} (High-Level Data Link Control Procedures)

```
      A standard for
      high level link control. (ISO 3309)
\item \underline{{\bf KA-Node}} A simple networking scheme
      developed by Kantronics.
      See section 3.3.2 for more info.
\item \underline{{\bf KA9Q NOS}} (KA9Q Network Operating System)
      A TCP/IP program
      originally developed by Phil Karn, KA9Q.  Currently there are
      many different versions available.  See section 3.2 for more
      information.
\item \underline{{\bf NET/ROM}} A scheme for packet radio networking.
      See section
      3.3.3 for more information.
\item \underline{{\bf NODE}} A network node.  Often a network
      node running NET/ROM.
\item \underline{{\bf TAPR}} Tucson Amateur packet Radio.
      Was the first group to
      create a packet radio TNC using AX.25.  Soon a TAPR TNC became
      cloned by many others.  TAPR continues development of packet
      radio equipment.
\item \underline{{\bf TCP/IP}} Transmission Control
      Protocol/Internet Protocol.  A set
      of utility programs used over AX.25.  See sections 3.2 for more
      information.
\item \underline{{\bf TNC}} Terminal Node Controller.  See section 1.4 for more
      information.
\end{itemize}

\newpage

\begin{center} {\Large{\bf Computing Network Resources for Amateur
Packet Radio}} \end{center}

This section summarizes the resources available on Internet for
amateur packet radio operators.
\vspace{.25in}

\noindent
{\large{\bf 2.1 What Newsgroups/mailing lists are available?}}

This is a list of all groups that regularly discuss amateur
packet radio.  For newsgroups, subscribe to the group through use
of your news reader.   For mailing lists, add a '-request' to the
end of the list name for subscriptions.  For listserv groups,
send mail to 'listserv' at the node which contains the list.  The
first line of the mail should be 'SUBSCRIBE groupname yourname'.
Send the command 'help' for more information.

\begin{itemize}
\item {\bf rec.radio.amateur.packet (Newsgroup)} \\
      General discussions involving Packet Radio.
\item {\bf rec.radio.amateur.misc (Newsgroup)} \\
      General amateur radio discussion.  Usually does not contain any
```

```
      particular information about Amateur Packet Radio.
\item {\bf rec.radio.amateur.policy (Newsgroup)} \\
      Discussion of regulation policies regarding every aspect of
      amateur radio.  Occasionally deals with polices of packet
      coordination and legal issues of packet radio.
\item {\bf rec.radio.swap (Newsgroup)} \\
      General For-Sale for any radio equipment.  Occasionally will have
      packet equipment for sale.  Recommended location for any amateur
      packet radio for-sale items.
\item {\bf info-hams@ucsd.edu (listserv group)} \\
      A digest redistribution of the rec.radio.amateur.misc Usenet
      discussion.
\item {\bf packet-radio@ucsd.edu (listserv group)} \\
      A digest redistribution of the rec.radio.amateur.packet Usenet
      discussion.
\item {\bf hs-modem@wb3ffv.ampr.org (mailing list)} \\
      Discussion of high speed modems and radios available and future
      plans.  Also includes discussion of networking using high speed
      modems.
\item {\bf tcp-group@ucsd.edu (mailing list)} \\
      Group discussion technical developments of TCP/IP over packet
      radio and use of the NOS TCP/IP programs.
\item {\bf gateways@uhm.ampr.org (mailing list)} \\
      Discussion of current gateways and future plans for gateways.
      May deal with sensitive internetworking issues.
\end{itemize}

For all lists at ucsd.edu, archives are kept of the discussions
and maybe access via anonymous FTP to ucsd.edu.  Some listserv
groups also have archives.  Send to the group's listserv 'help'
for more information on commands.  Digests for the ucsd.edu
discussions are available.  Send mail to listserv@ucsd.edu with
the first line being 'longindex' for more information.
\vspace{.25in}

\noindent
{\large{\bf 2.2 What anonymous FTP sites are available for getting packet
radio information and programs?}}

This is not an inclusive list of FTP sites, but these sites carry
a large portion of the programs available.  Consult the Archie
archive server for info on particular files.  Send mail to
archie@cs.mcgill.edu with the line 'help' for more information on
archie file searches.

\begin{itemize}
\item {\bf ucsd.edu} \\ Primary distribution site of KA9Q's TCP/IP packages.
      Also, general packet radio information.
\item {\bf simtel20.army.mil} \\ Very large collection of amateur radio
      software.
\item {\bf wuarchive.wustl.edu} \\ Mirror site of Simtel20 archives.
      Easier to
      use then the simtel20 archive.
```

\end{itemize}

\newpage
\noindent
{\large{\bf 2.3 Are there any gateways for mail or news between internet and amateur packet radio?}}

Currently, there is no general use gateways between packet radio or any other computer network. The primary problem with such gateways is required content of amateur packet radio. Most wire based networks do not have any rules on content (such as profanity or business) like amateur radio does. Therefore, all traffic destinated to amateur radio has to be hand filtered.

However, there are several experimental wormholes that are being tested through Internet. See the discussion on the gateways discussion group for more information.

\newpage

\begin{center} {\Large{\bf Networking and special packet protocols}}
\end{center}

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.
\vspace{.25in}

\noindent
{\large{\bf 3.1 Are there any other protocols in use other than AX.25?}}

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.
\vspace{.25in}

\noindent
{\large{\bf 3.2 What is TCP/IP?}}

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix System V,

and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.
\vspace{.2in}

\noindent
{\large{\bf 3.3 Networking Schemes}}

\noindent
{\bf 3.3.0 What are some of those other networking schemes?}

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.
\vspace{.2in}

\noindent
{\bf 3.3.1 Digipeaters}

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if it's call was in the digipeater field, it would resend the packet.

\newpage

\noindent
Digipeaters
allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.
\vspace{.2in}

\noindent
{\bf 3.3.2 KA-Nodes}

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections because acknowledgments only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.
\vspace{.2in}

\noindent

{\bf 3.3.3 NET/ROM}

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM as if connecting to any other packet station. From there, he can issue the NET/ROM commands to instruct it to connect to another user locally or connect to another NET/ROM. This connect then connect again means that to a user's TNC, you are connected to a local station only and it's transmissions does not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM don't use all of the AX.25 protocol. Instead, they use special AX.25 packet called Unnumbered Information (UI) packets and then put their own special protocol on top of AX.25. This is again used to increase efficiency of it's transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network, but if band conditions such as ducting occur, often unreachable nodes are entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.
\vspace{.2in}

\noindent
{\bf 3.3.4 ROSE}

Rose is another networking protocol derived from X.25. Rose nodes have a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

The static routing tables ROSE uses ensures that packet routing does not use unreliable links such as NET/ROM suffers from. However, ROSE suffers from it's inability to change it's routing table as new nodes come on line. The operator must manually change every routing table, thus ROSE networks require greater maintenance times.

I'm a student in computer science and I'm looking for
a modem that could be used both on Packet Radio and with
a standard telephone line.
Does exist such a modem/packet controller ?

Any help will be appreciated.

I realise this is probably a FAQ, but, where can I find out the KISS
protocol specification? I'm looking to do a CP/M implementation.
I gather it's a framing protocol, much like SLIP, but the bits I looked
at certainly aren't SLIP...

And on the subject of FAQ's, is "HOST" mode any relation to KISS? I have
vague recollections of watching with amusement, with the aid of a serial
analyser (sadly no longer available), of the SV7AIZ BBS software belting
the heck out of the TNC... I think it used HOST mode - it certainly was
going "hammer and tongs" anyway, and needed a special EPROM for it. That
was long ago (we run W0RLI now) so my memory is hazy.

Final FAQ: are the specs for NET/ROM, ROSE, and other level 3 protocols
available? I'm the sort of weirdo who prefers to "write his own".

gateway
From: barry@bbs.ve3jf.ampr.ORG (Barry McLarnon)
Newsgroups: rec.radio.amateur.packet
Subject: KAM/NOS Query
Message-ID: <61@bbs.ve3jf.ampr.org>
Date: 24 Oct 91 00:16:25 GMT
Sender: daemon@ucsd.Edu
Reply-To: barry@hs.ve3jf.ampr.org
Organization: UCSD Usenet Gateway
Lines: 31

The following comes from Glenn VE3GCI... I know zilch about KAMs, but I'm
sure there must be some KAM gurus on the net. I don't think there's a way
of putting a TNC into KISS mode using the autoexec.net file, but there are
probably some little programs around that can do the job from a batch
file. All replies will be relayed to Glenn...

--- begin included message ---

           I am presently installing NOS to run packet. My TNC is a KAM
and I have questions on how to set KISS mode on when I load NOS. I don't

want to perm it in so at present I load PCPLUS, set INtface to KISS, CONMode to TR, and RESET. Then I get out of PCPLUS, load NET and away I go. I think there must be a way to insert a statement in the AUTOEXEC.NOS file to do this but if there is I cannot figure it out. If there is a way will it also work for a PK232?.

The other question I have is how to specify that I want to use the HF port of the KAM which I assume will be AX1. My attach statement for port 0 is as follows: attach asy 0x3f8 4 ax25 ax0 2048 256 9600. Hope this helps.

I have been running MSY and all the above works fine so if I can get the parameters set correctly for NOS then away it should go.

Thanks very much for your time.

On the Amiga version of NOS I have a small ARexx exec which sends the commands
to the serial port and then starts AmigaNOS. I suppose that you could
accomplish the same thing by copying a text file (with the commands in it) to
the COM port from a .BAT file.

>protocol specification? I'm looking to do a CP/M implementation.
>I gather it's a framing protocol, much like SLIP, but the bits I looked
>at certainly aren't SLIP...

KISS is a subset of SLIP. (or the otherway around, anyway it's close :-)
I haven't seen it written down as such however the earlier releases of
KA9Q included source for kiss for several TNCs.

The protocol is rather simple. Two defined characters. (I've forgotten
the values). One is a flag and the other is an escape. The Flag just delimits
frames while the escape is used whenever an escape or a flag is included
in the frame.

>And on the subject of FAQ's, is "HOST" mode any relation to KISS? I have

No. "HOST" is a a TNC<->BBS protocol where the TNC still does all of the
AX25 work. It just provides multiple connects and an easier interface to
program for and interpret using code than the TAPR interface which was
designed for humans.

>Final FAQ: are the specs for NET/ROM, ROSE, and other level 3 protocols
>available? I'm the sort of weirdo who prefers to "write his own".

I haven't seen one. I'd also be interested in seeing it. You might
place a post in rec.radio.amateur.packet asking about it. Otherwise
you can grab the source to KA9Q and try and work it out! :-(

Carl.

  I connect to a node in Trevose, Penna known as BEARS2. This node
constantly disconnect me. Does anyone else have problems like this?
My 'STA' light drops within the first or second send almost always,
the station on the other side of the node also get acknowledged
quickly also, yet in the middle of a transmission, the old
"BEARS2 DISCONNECTED" message appears for no reason. This is a
very busy node, however, these disconnect make it absolutely
useless. These results have been tested with many TNC owners
running various equipment....same results.

  My educated guess is that the 'connected table' is getting wiped
out with data buffer overflows when the node gets busy. The recent
increase in TCP/IP activity has made normal Node communications almost
impossible to stay connected.

  Anyone able to shed more light on this problem?

While we're on it: Is it possible to the get the Kantronics
KAM together with something like a g3ruh modem. I think
not, but I thought I'd ask. I expect that if it was possible,
it would require some hacking on the firmware, as I beleive the
KAM does HDLC in software.

From article by barry@bbs.ve3jf.ampr.ORG (Barry McLarnon):
> The following comes from Glenn VE3GCI... I know zilch about KAMs, but I'm
> sure there must be some KAM gurus on the net. I don't think there's a way
> of putting a TNC into KISS mode using the autoexec.net file, but there are
> probably some little programs around that can do the job from a batch
> file. All replies will be relayed to Glenn...

The current versions of PA0GRI NOS have the following function:

     comm <interface> <text_string>

which may do what you want.

My solution to the problem is to put the commands needed to enter
and exit KISS mode into two files, enkiss.txt and dekiss.txt. Then
in my nos.bat batchfile I do:

copy enkiss.txt com1:
nos_blah.exe
copy dekiss.txt com1:

I can't remember what dekiss has in it. Probably FEND 255 FEND.

You can't create this file with a normal editor!

Hope this helps!

I forgot to mention, there is one advantage that the use of the dialer feature
in NOS has over the 'comm' command (or simply copying a file to the com port in
your nos.bat file). The dialer file can contain 'wait' commands which will
force the dialer to wait for a response stri. You can put a 'wait' command
between each 'send' so that the TNC doesn't choke on a whole bunch of commands
at once. This is not important if your PK-232 has the most recent KISS
implementation in it, but it is important for older PK-232's and other brands

of TNCs.

>will it also work for a PK232?.

Actually, there is a way to do this within the autoexec.net file (depending on
which version you're using). One way is to use the 'comm' command and just
send the 'kiss on\r' string to the PK-232. I don't believe vanilla NOS has
the 'comm' command but other variants do (the PA0GRI variant does).

Another way to do this is to use a dialer file and start a dialer session to
your comm port right after you 'attach' it. Your autoexec.net would have
something like 'dialer ax0 filename' where filename is a file that contains
something like:
send "kiss on\r"

The dialer command is part of vanilla NOS.

If you are running a PK-232 with some really old PROMs, you'll have to send it
a bunch of other commands in addition to the 'kiss on' command. Your manual
should mention what these commands are if necessary.

You can get the KISS TNC spec by anonymous FTP from ucsd.edu, file
/hamradio/ka9q/arrl/1987/kisstnc.ms.Z. This is a compressed NROFF
source file for the paper K3MC and I wrote for the 1987 ARRL CNC.

phil@pepper.NCD.COM (Phil Graham) writes:

>Is there anyone out there who has experiance with the Kantronics Data
>Engine / 9600 baud modem and there 440 radio?

I've posted several articles about this in the past, so forgive any repetition. Here in Dayton we're building a metro area network using the Kantronics D4-10 radios.

They are designed to run at 19.2KB, but will work at 9600 (or any slower speed, for that matter). As radios, they are quite good. Rated power is 10 watts; with a stiff power supply we see about 12. The receiver is quite good, and <much> better than the one in the DVR2-2 2M 9600 baud radio, which has a front end like a barn door. It's two channels, crystal controlled.

The radios switch extremely quickly, and we've run a pair of them with a TXDelay as short as 5 milliseconds (not a typo...). They also have a very fast squelch, and it seems to be quite reliable and usable as a DCD signal. I really only have two nits with the design: 1) there's no S-meter or access to a signal strength level without doing your own mod, and 2) there's a TX LED on the front panel, but nothing to indicate open squelch (the radio doesn't have a built-in speaker)..

The radio has one unique feature. As well as the standard analog level inputs, it also has a digital, TTL-level port, with pins for TXD, RXD, DCD, and PTT. The TXD signal will directly modulate the radio +/- 10KHz, and the RXD is derived from an on-board data slicer. In other words, you could shove raw TTL level data into one of these radios, and recover it at the other end, with no intermediate modulating equipment at all. The D4-10 could properly be called an RF modem.e

Regarding modems, you have two choices: the Kantronics DE9K6/19K2 modem is designed to go in the DataEngine (though it could be used elsewhere) and works at either 9600 or 19.2. It's essentially the G3RUH design, with all the analog stuff bypassed for 19.2.

Or, you could do as we're experimenting and run without a "modem" at all;
we're using various means to generate packets, but instead of sending them
through a modem, we're shipping them directly into the TTL level data port
of the radio. It sounds screwy, but it seems to work, and it saves the ~100
cost of the modem.

We currently have ten D4s in hand, and are building a duplex digital repeater
out of two of them, and using others for links from Dayton to the rest of
the world. We hope to have at least five real users (all running tcp/ip)
and a couple of servers (local BBS stations, etc.) on line by spring.

     The interface for the W2 would be the same as for any other Icom walkie
with the exception that you would use a single 3 conductor plug. The standard
interface for Icom's is one plug with ground and mic/PTT and the other is ground
and spkr. The W2 is the same in that the two grounds become one and connect to
the shell of the plug. The spkr out is the tip, and the mic/PTT is the ring. It
works exactely the same as the standard Icom interface.

I have used my W2A with a PK-232 for packet with no problems. Like the
other post said- you hook it up just like the old icoms except that
everything gets connected to the one plug instead of two plugs like on
the "g" series HT's.

Looking for information about AX.25, i.e. the document that
describes the protocol. I have early versions of such documents,
but they pre-date version 2 of the protocol. I'm looking for
the full spec - state tables, transition diagrams, etc.

Is there a machine readable version available?

What organization maintains the standard for the protocol?

Is a similar document available for the NET/ROM (and
friends) protocols?

I am interested in receiving/sending mail to other hams via packet radio in some place besides my only contact who lives about 5 or ten miles from me. Please reply here in e-mail.

And at the same time I need some help with getting my pbbs to work. I am using a KAM and have config'd it according to the manual. I had someone try to connect and he said all he got was the connect message and nothing more. The manual said to set the PBCALL to something different than MYCALL, ALIAS, etc, which I did. Any suggestions?

Multiple tasks under DOS and a '286 can be tricky. Adding interrupts from a serial port tend to shorten the string a bit more. If you want something that is (a) solid, (b) runs under DOS [where us proletariats live], the way to go
     Digital Research Multiuser DOS and a '386 machine

I downloaded a program called SP from Compuserve that uses a tnc with
wa8ded style host mode firmware. The archive came with firmware from
Nord<>Link's version of firmware for the tnc2 and the tnc220 (pac com).
This was the first time I saw firmware for the tnc220. It is version
"The Firmware Version 220-1.1 (2.1d) and dated 09.11.88. It has a bug
in it which causes the 8530 to hang in mid-packet like it missed an
interrupt.... Anyway, the question: Does anyone know where to find
"Host Mode" firmware for the tnc220... a different version or a newer
version? I would love to be able to run SP and ARES/DATA not to mention
having a reasonable interfact between the tnc and a computer.

Good Day,

  I'm wondering if anyone might assist me in finding information regarding high
speed radio/packet networks, both ham and/or commercial. I'm aware that there
is a group in Ga. who's running 56kbps. Can anyone tell me who I would speak
with down there, or elsewhere in the country, regarding links >9.6kbps? I'm

interested to know what radio (&mods), frequencies, modes, modulation techniques, rates and distances transversed, in which people have experimented with. I'd also be interested in knowing successes and failures those persons have encountered, as well.

Any info is more than welcome. Please respond direct and thanks for your time.

andy (ka1gd) 202-767-2493

Sorry if this is a FAQ but I didn't see one anywhere. I would like to know what is the minimum set-up required for packet radio. I already have a 386/25 running DOS and a UNIXPC so I'm only interested in the radio end of things. I'm in an apartment as well, can I do anything without a big antenna? Where can I find used equipment? Finally, what licencing is required?

Email or post
Thanks
Edgar Tooley

[Most of us would simply call it a "TNC", but read on...]

I picked up this thing at a "hamfest" recently. It has all the trimmings
of a TNC - even the command set, with one or two exceptions, but the manual
is suspiciously devoid of any reference to Amateur radio, TNC, BBS, AX.25 etc.
Even the "connect" examples use names such as "BOB" etc. It looks like an
Amateur product sanitised for the commercial market. The box itself looks
like a KPC-2 (according to a photo in a book I have - I've never seen one)
and has the usual complement of LED's, except that PTT and CD are called TX
and RX respectively. The CALibrate command, instead of toggling between
high and low tones, generates a square wave on transmit, and expects a
square wave on receive, upon which it display two numbers, which are supposed
to be equal (is this a Kantronics standard?).

Anyway, it's all hooked up and raring to go, but it won't decode a single
packet! It doesn't get digipeated through the local repeater!

So, either I've made some gross error with audio levels (I doubt it,
the tones sound normal on xmit and DCD lights up on rcv) or, just possibly,
it doesn't use AX.25 ... You know, NRZI, HDLC and all that... If it
helps, the EPROM rev is 2.03 (the same as the one in the photo, in fact).

Pulling it apart shows there is no HDLC engine inside, such as an 8273,
but a 6303 (?) microprocessor, a 7910, a 2400 bps modem chip, and sundry
glue logic etc.

Has anyone seen one of these things? Do I need an "amateur" EPROM for it?

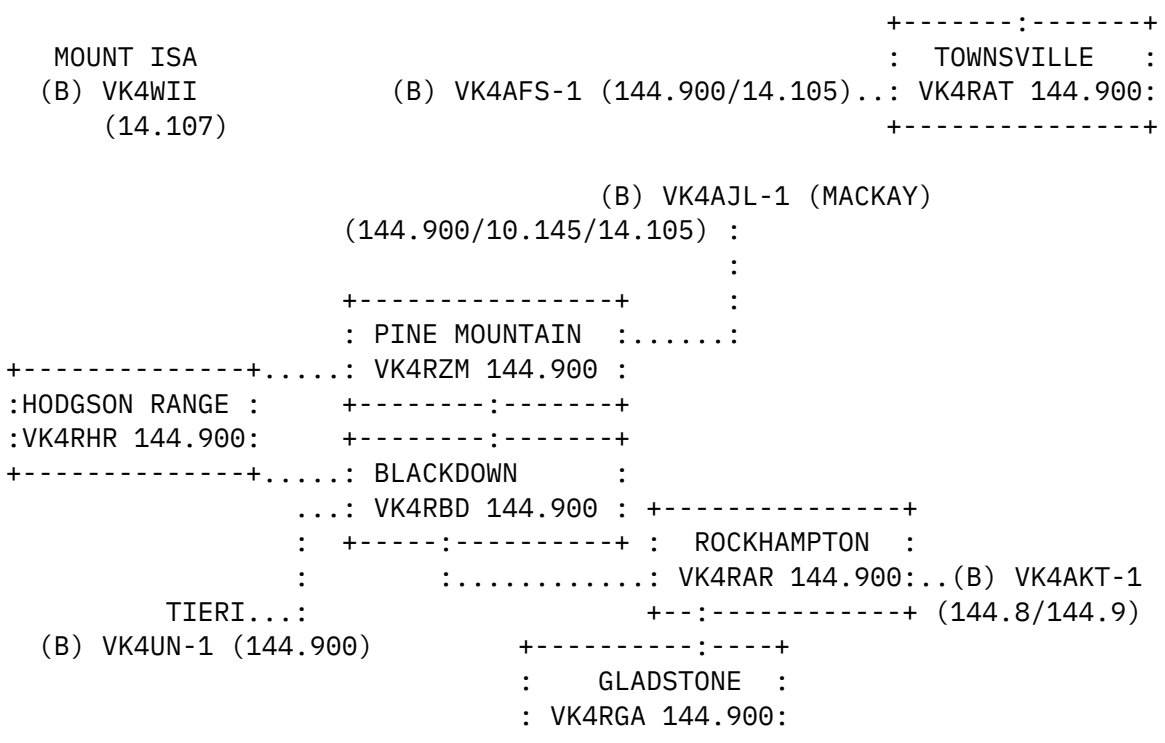
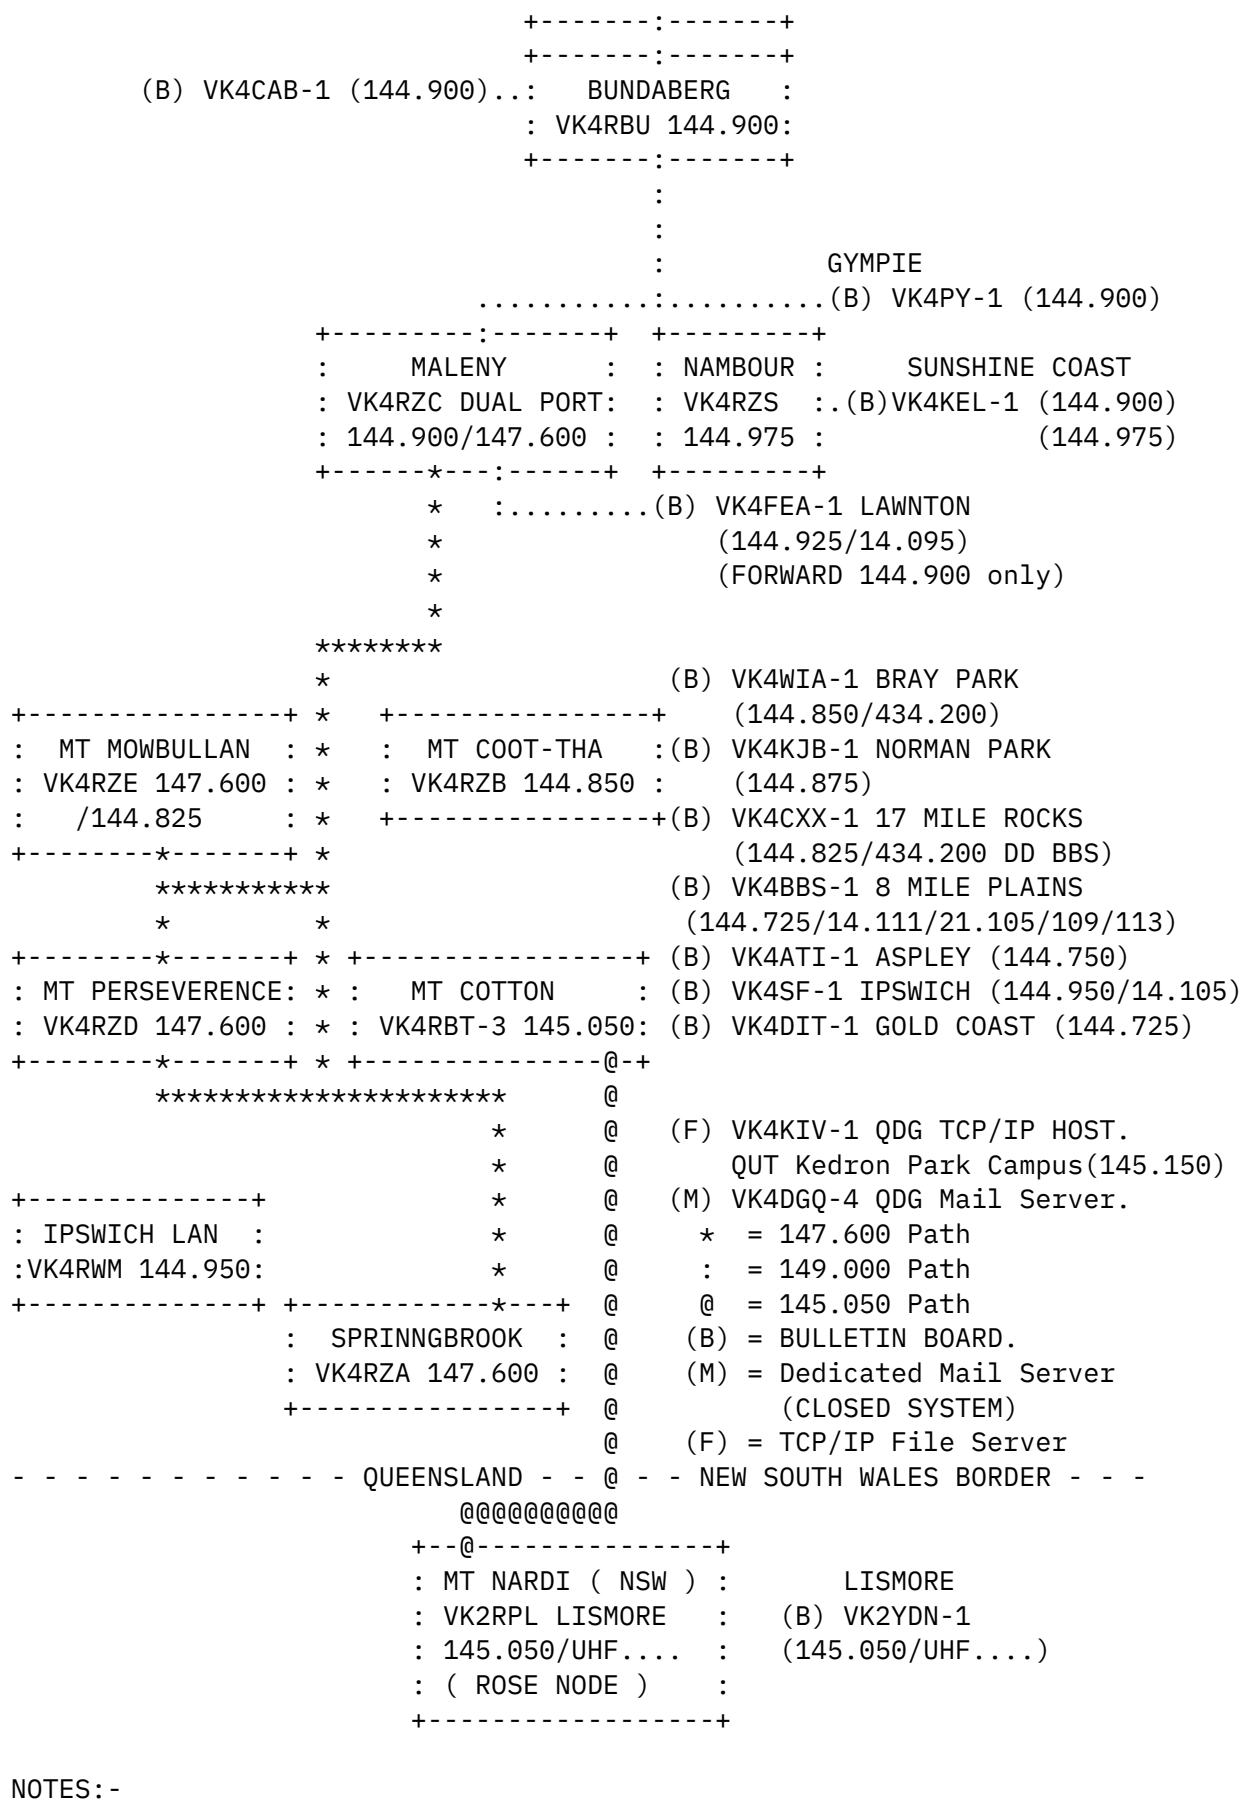
The subject says it all!



I have the software that came with the packet kit from Ramsey Electronics.
Although it works okay, I would like to find out if there is any other software
out there. (Support for 80 columns would be very nice...)
Either Commodore 64 or 128 versions are okay.



Thanks.

VK4DGQ-1 is a closed system, only allowing connection by the BBS'S shown in the map. Should the system fail, there is a back-up redundancy plan in place. All Private mail is forwarded 24 hours a day, and Bulletins are forwarded between 11pm and 6am daily.

Hope you find this information of some interest. If you have any other questions to VK4ZGJ who maintains VK4DGQ-1.

The mail server is a 286 with an 80 meg Hard Disk, running Software by AA4RE. The Server currently connects in the following order:-
VK4BBS
VK4CXX
VK4FEA
VK4KJB
VK4SF
VK4ATI
VK4WIA
It cycles the above every hour, 24 hours a day. The TNC is a PK-88 that has been modified and now is capable of doing up to 256 external commands. It is currently controlling the memory channels in the ICOM IC-28A radio. This method gives it its flexibility.

The latest copy of AmigaNOS (The Amiga port of the KA9Q TCP/IP system) is
now available on jh.mcc.ac.uk [130.88.202.27] using anonymous FTP. The
filename is KIT28H.LZH, but is not a complete kit of NOS but just some
of the changed extra files. The Listserv option has been removed until
I get it working correctly. The DIR/LS commands (and W from the mailbox)
use the ARP 1.3 version of LIST and so I have included that along with
the ARP.LIBRARY. The more command on the NOS menu has been replaced by
a call to the excellent LESS program, which is also used by the NOS help
command to display extracts from the NOS manual. I have included the
NOS command help files (most of them anyway!) which should be placed in
the Spool/Help directory.

John.

p.s. The PCSX here will be left on overnight between 1800 hrs GMT and
      0900 hrs GMT, most nights during the week. The last time I put
      a file on the PCSX, there were over 50 people grabbing a copy over
      a period of 3 days, from all corners of the globe. (not to mention
      all the other files in the directory)

Looking for assistance on linking ROSE nodes which can't hear each other directly via several digipeaters which are NOT ROSE nodes. The docs give an example of linking two ROSE nodes through one digipeater. Is it possible to link them through more than one digipeater? If so what needs to be setup? Any assistance would be most appreciated by our ROSE operators.

I'm a relatively new HAM and want to get started on packet. I've got an Amiga and want something simple for VHF and UHF only. Any suggestions on TNCs preferably with a 2400 baud modem? I'd like to have it be NETROM compatible (or similiar) and want to play around with AX.25 and TCP/IP. I'm still a little fuzzy on some aspects of this part of the hobby and I figure the fastest way to get up to speed is just go out and get a TNC. Just want to make sure I don't buy a TNC that's too limited but I don't want to spend a fortune and buy something that's top of the line either.

I've heard good things about AmigaNOS and would like to get this, anyone know if it is on phone line BBSs anywhere or a public network like GEnie? I don't think the UNIX system I use at work would allow me to transfer a file, only messages.

In Sunnyvale, try N0ARY-1 on 144.93 MHz. Or just monitor on different
freq's and use the mheard function to find which BBS's you can hear
well.

Actually, all of the BBS's in the Bay Area are linked together, so they
all have the same bulletins.

Send me a message when you get on.

This ought to be a FAQ, but I haven't seen on that list, yet.

To get started in packet, you first need to get an Amateur Radio
Licence. The recently enacted no-code Technician license is just fine.
(You also get voice, TV, satellite privileges as well.) Radio Shack has
study guides. The ARRL and others also print good books.

To take the exam you may need to contact the
  American Radio Relay League
  225 Main Street
  Newington, CT 06111

(All of the above is well covered in FAQ's)

You have more than enough computer. You will need a transceiver for the frequency band(s) of interest. 2 meters is currently most popular, but more and more folks are using 70 cm and others. A 2 watt handi-talkie and a 1/4 wave whip should be enough to get you started, on the radio end. I suggest having 10 feet or MORE between the radio and the computer to lessen difficulties with RFI.

The last piece is the terminal node controller or TNC. This is basically a specialized modem with a built-in processor to handle details like collision detection, when to transmit, etc. TNC's run from $100 to $300. The more expensive models provide other modes like RTTY and FAX which some Amateurs like to use.

Three companies make most of the TNC's sold in the US. AEA, MFJ, and Kantronics. You can find their addresses in any of the magazines written for ham radio, such as QST or 73. My personal choice was the Kantronics All Mode (KAM) together with their software for the computer. Since you are just getting started, I would recommend a more basic model at first.

One thing Paul forgot to mention is the "software TNC", where nearly all of the functionality of the TNC is performed by the computer you already have. The only hardware you need is a 1200 baud modem that can be constructed for about $40. (Your average 1200 baud phone modem will *not* work for packet). Two software TNCs exist for the IBM PC: BAYCOM and PMP. Both are available via anonymous FTP from wuarchive.wustl.edu in /mirros/msdos/packet.

If you have enough hardware experience to know which end of the soldering iron gets hot, I'd suggest getting started with a software TNC. You can't beat the price and the satisfacting of building something yourself is GREAT! On the downside, the software TNCs won't work with other packet software (like NOS for TCP/IP).

DISCLAIMER: I wrote PMP. The latest version can always be found on
          'helios.tn.cornell.edu' in /pub

I'm sorry of this is a FAQ but...

I have just come across this newsgroup for the first time and I'm not to sure what its all about. Am I correct in saying that packet radio allows someone with a PC access to things like the Usenet and all those ftp sites around the world? If so, those anyone know of any hardware/software for the Atari 520ST that will allow me to use packet radio? I live in Ireland, so if anyone here knows what I have to do in order to get one of these - licences, etc. - I would appreciate it if they could pass on the info.

Thanks a million everybody!

Radio. 3

1.0 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small burst, or packets.

1.2 What is amateur radio?

Amateur Radio is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc.

1.3 Why packet over other digital modes:

Packet has one great advantage over other digital modes : automatic operation. Packet TNC's are very advanced as far as automatic control go. Just simply connect to the other station, type in your message, and it is sent automatically. Any packet TNC can be used a packet relay station, or a digipeater. This allows for greater range by stringing several stations in a row.

On HF, this allows for contacts with stations normally not in propagation range.

Packet radio provides error free transmissions because of built in error detection schemes. If a packet is received, it will be correct.

Also, on VHF/UHF packet, packet operators are allowed to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBS's (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to simultaneously use the same frequency simultaneously.

1.4 What elements make up a packet station?

A TNC (Terminal Node Controller)
A TNC contains a modem to decode the audio signals into digital signals. It also contains a micro-computer handle to convert the digital signals into text that can be sent over a RS-232 port to the computer. The CPU also handles the protocol overhead of the packet station. When you send data, it takes the text, puts error checking on it (CRC) and also puts it in an envelope for sending. When receiving a signal, it takes it out of the envelope, and sends the message to the computer.

Computer or Terminal
This is the user interface. A computer running a terminal program or just a dumb terminal can be used. For computers, any phone modem communications program can be adapted for packet use or customized packet radio programs are available.

A radio
For 1200 baud operation (normal user access), a standard voice radio can be used. For UHF or VHF packet, Narrow band FM is used, normally on simplex channels. For HF packet, 300 baud data is used over single side band modulation.

1.5 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSCA/CD ?????? (Carrier Sense Collision Avoidance / Collision Detect) If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is

transmitting, then the radio keys up and the TNC sends it's packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet again.

1.6 What is AX.25 ?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified. AX.25 also included a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the senders and recipients amateur radio callsign, thus providing identification with every transmission.

1.7 Definitions: Commonly used terms in Amateur Packet Radio

HDLC : (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

AX.25 : Amateur X.25 protocol. The basis of most packet systems. See section 1.6.

TAPR : Tucson Amateur packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

digipeater : A packet radio station used for repeating packets. See section 3.3.1 for more information.

digi : Short name for a digipeater

NET/ROM : A scheme for packet radio networking. See section 3.3.3 for more information.

TCP/IP : Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

KA9Q NOS : (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

NODE : A network node. Often a network node running NET/ROM.

KA-Node : A simple networking scheme developed by Kantronics.
See section 3.3.2 for more info.

CSCA/CD ???? : Carrier Sense Collision Avoidance / Collision
Detect.

TNC : Terminal Node Controller. See section 1.4 for more
information.

AMPR : An abbreviation for Amateur Packet Radio.

44 net : The class A network designator for TCP/IP amateur packet
radio. All numerical TCP/IP addresses are in the format of
44.xxx.xxx.xxx.

ampr.org : The organization recognized on Internet for amateur
packet radio TCP/IP.

3.3.2 KA-Nodes 2
3.3.3 NET/ROM. 2
3.3.4 ROSE 3

3.0 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix System V, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

3.3.0 What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

3.3.1 Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if it's call was in the digipeater field, it would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

3.3.2 KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections because acknowledgments only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

3.3.3 NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM as if connecting to any other packet station. From there, he can issue the NET/ROM commands to instruct it to connect to another user locally or connect to another NET/ROM. This connect then connect again means that to a user's TNC, you are connected to a local station only and it's transmissions does not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM don't use all of the AX.25 protocol. Instead, they use special AX.25 packet called Unnumbered Information (UI) packets and then put their own special protocol on top of AX.25. This is again used to increase efficiency of it's transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network, but if band conditions such as ducting occur, often unreachable nodes are entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

3.3.4 ROSE

Rose is another networking protocol derived from X.25. Rose nodes have a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

The static routing tables ROSE uses ensures that packet routing does not use unreliable links such as NET/ROM suffers from. However, ROSE suffers from it's inability to change it's routing table as new nodes come on line. The operator must manually change every routing table, thus ROSE networks require greater maintenance times.

2.0 Computing Network Resources for Amateur Packet radio . . . 1
2.1 What Newsgroups/mailing lists are available?. 1
2.2 What anonymous FTP sites are available 2
2.3 Are there any gateways for mail or news 2

2.0 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, subscribe to the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name for subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup):
General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup):
General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup):
Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with polices of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup):
General For-Sale for any radio equipment. Occasionally will have

packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (listserv group):
A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (listserv group):
A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

hs-modem@wb3ffv.ampr.org (mailing list):
Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (mailing list):
Group discussion technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (mailing list):
Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

For all lists at ucsd.edu, archives are kept of the discussions and maybe access via anonymous FTP to ucsd.edu. Some listserv groups also have archives. Send to the group's listserv 'help' for more information on commands. Digests for the ucsd.edu discussions are available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

2.2 What anonymous FTP sites are available for getting packet radio information and programs:

This is not an inclusive list of FTP sites, but these sites carry a large portion of the programs available. Consult the Archie archive server for info on particular files. Send mail to archie@cs.mcgill.edu with the line 'help' for more information on archie file searches.

ucsd.edu : Primary distribution site of KA9Q's TCP/IP packages. Also, general packet radio information.

simtel20.army.mil: very large collection of amateur radio software.

wuarchive.wustl.edu: Mirror site of Simtel20 archives. Easier to use then the simtel20 archive.

2.3 Are there any gateways for mail or news between internet and amateur packet radio?

Currently, there is no general use gateways between packet radio or any other computer network. The primary problem with such gateways is required content of amateur packet radio. Most wire based networks do not have any rules on content (such as profanity or business) like amateur radio does. Therefore, all traffic destinated to amateur radio has to be hand filtered.

However, there are several experimental wormholes that are being tested through Internet. See the discussion on the gateways discussion group for more information.

Thanks to whoever posted the original query and the answer! I now have
KISS mode with my Heath HK-21 Pocket Packet TNC. Does anyone know of
a manual for the new firmware? I have figured most of it out, but there
are a number of new commands and the indicators act odd in KISS mode.
Any help would be appreciated.

Packet has become multifaceted. The most common packet operation remains
1200 baud activity on the 2 meter band. For this you will require a TNC
and a voice grade FM radio for 2 meters. The minimum license is the
Technician class license. The Novice class licensee can use packet too,
but is limited to three less popular bands and reduced power.

If you are interested in direct worldwide contacts, you will need a
General or higher class license and an HF SSB radio and a TNC for
300 baud communications. This generally requires a big antenna.

If you desire high speed communications, 2400, 9600, 19200, and 56000
baud equipment is available for use at VHF and UHF. In the cases of
9600 and 19200 baud, specially modified radios are required. In the
case of 56 kb, the modem *is* a radio and only a frequency translator
called a transverter is required to put it on the UHF band of choice.
A Technician license is suitable for these activities. Needless to
say, others must also be using high speed packet in your area if you
want to operate high speed, unless you are satisfied with talking
to yourself.

The safest way to get your feet wet is to start at 1200 baud on 2 meters
where activity is highest. Later you may want to try the higher performance
modes.

I am looking for anyone who might have the source code for the
G8BPQ packet switch. Reason.... want to try to get the driver
set for the Ottowa P.I. card into it. Has anyone done it? I am
not a software type.. only hardware. Can anyone be of any
assistance?

Thanks... de Sam

Can anyone tell me just how many regions on the Packet radio BBS newtwork
utilize a Buleltin designator that is supposed to cover the whole World?

I think in Europe they use either @WW or @WWW but here in Australia
we see all @WW/@WWW bulletins swapped to @ASIA (or @AS) bulletins.

Is there a designator used worldwide? If not should we implement
one (extend the existing one used in Europe)? I would seem to
help out at least from looking at this end. At the moment, if I
want proper world wide coverage I send to @ASIA (or @AS) for all of AsiaNet
and Europe (it gets swapped to @WW somewhere on the path to Europe it seems)
and then another copy addressed @USA to cover the United states and
then another to @JPN to make sure it gets into japan.

So what should it be? Should we (sysops) change anything?

Comments / hints welcome. Flames > /dev/null

Cheers de Grant VK5ZWI

Having recently gone through the hassle of making cables for 3 radios
and 2 TNC's, I sure agree that a standard would be nice. Let me make an
addition to your list. RCV audio from the radio to the TNC. My IC-751
has such a connection. On HF, it is nice to be able to monitor the
received signal and adjust the volume as desired (or all the way done),
while the TNC is connected.

Subject: DSP developers query

Chris--

I am an amateur radio operator. Many new products for digital
signal processing applications are coming out, but they have
rather high price tags. Also, they are stand-alone products
which must be connected to a PC or Mac.

Is there a network of Next users that I could pose a question to?
I am interested in reaching anyone who is doing development work
in two areas related to DSPs and radio communication. The first
is voice signal processing to digitally enhance the reception of
shortwave transmissions. The second is the use of programmable
DSPs to act as high-speed modems for the radio transmission of
data.~

If you know of a way to distribute this query, that would be
great. I can be reached at davef@uworld.com.~

Thanks in advance!

I was going to ask if anyone had made a data radio already. It seemed such an obvious thing to do; I assumed they could already be bought. I'd like to hear about any other production or experimental radios designed specifically for data.

Does the Alinco design perform the modem function? Does it perform the TNC functions? What additional equipment will be needed?

> Now I wonder, if Alinco plans a 440 version of the rig...inquiring

I'm trying to set up the F6FBB program (5.13) and I'm having some problems with it.
     When I start it, it goes through the callsign setup and I notice that there is a bunch of garbage characters in the window. What is it loading in

at this point and why is there junk in it?
     After it comes up with 'Starting multitasking', it then just keeps doing:

Recv < >, FFFF
Recv < >, FFFF

     and etc... I can't break out of it either.

This is a copy of the error.sys file in the FBB directory.

> *** System boot on 08/10/91 04:00 ***

Was wondering what some of this means?
     If anyone has some more docs on the programs and some info on some of the files that aren't in the regular docs, let me know where they can be obtained from.

Yes, and I wish it didn't. We keep getting bulletins which are really only intended for Asia. Why do some people insist on changing the distribution of messages?

I don't care what it is, so long as everyone uses it, but my preference would be WWW.

I believe it means 440MHz, i.e. the 70 centimetre band.

I have lost the original posting, is the DR-1200T for 23 cm? If it is, that is just what we desperately need here...

Would someone please email me the original posting, or repost it here? Thanks.

Has anyone had experience using >256 byte packets over G8BPQ nodes?

The question is whether a netrom network built exclusively from BPQ switches can use a paclen longer than 255 to allow, for example, ethernet-length tcp/ip frames without fragmentation.

The BPQ config file indicates that you <can> use longer values of paclen

than the standard 255, but doesn't give any detail about what the maximum is and whether you can, in fact, wrap long packets in netrom frames.

Please note: 1) We're contemplating this question in relation to clear channel, highly reliable links. I'm not worried right now about how <well> long frames will work, but rather <if> they will work. 2) In this exercise, we're not worried about compatibility with non-BPQ netrom nodes.

A second, related question: assuming a BPQ node that is strictly a two port, point-to-point link (each port communicating with exactly one other station) and no user port, would it make more sense (less overhead, etc.) to digipeat across ports (it appears BPQ can do that) than to use the switch as a netrom node?

Accessing the internet and ftping big files off of it is still just a gleam in most of our eyes. There are a few Usenet->packet gateways operating and some Email links, but it isn't widespread yet. You're getting in on the start of something new. It may grow to be a giant, or a monster, we don't know yet. Help us find the way.

I can't help you with source for the G8BPQ code, but perhaps now is a good time to mention that I have been working on packet driver (compliant with the specification by FTP Software, Inc.) for the Ottawa PI card (note the spelling ... sorry Sam ;-).

It's running, and after a little more "beta" testing I will make it generally available. Maybe this interface would provide a good vehicle for adding drivers to the G8BPQ software. I've heard rumours that the author is working on this - can anyone confirm or deny?

Cheers,
Dave

I may be getting in over my head here, but what the heck.

My understanding is that you can have PACLEN greater than 255, but since
net/rom is actually limited to something like 236 (????) what happens is
that you end up with a 236 byte packet and then an X byte packet to total
you paclen. In other words if you set paclen to 255 you get a 236 byte
packet and then a 19 byte packet. The packet limit of net/rom seems
to be the most efficient size.

Comments??

If someone wanted to write a REALLY good article for CQ, 73 or QST, they
could do one on optimizing the Ramsey kit 2m transceiver as a data
radio. Probably some simple changes, easy to incorporate during
construction, and some packaging and convenience factors would do
the trick.

Hint. Hint.

Greg

The only special hardware required for packet radio is a Terminal Node
Controller (TNC). These are available from many manufacturers. Just pick
up a recent copy of any amateur radio magazine. They all have an RS-232
port that connects to the serial port on the back of your computer.

I only know of two software packages for packet radio for the Atari ST:

1. PE1CHL(?) NET - based on KA9Q TCP/IP. Can be used over radio with a
         TNC or over phone line to access Unix systems with ftp.
2. Packeterm - based on W0RLI BBS with terminal emulator added.

They are both free programs available from numerous user groups. Two that
specialize in ham radio applications for Atari computers are:

     Atari Microcomputer Network
     John Adams KC5FW
     17106 Happy Hollow
     San Antonio, TX 78232
     U.S.A.

     ASTUR (Atari ST Users on Radio)
     GEERAERT Michel
     W. Elsschotlann 21
     B-8460 Koksijde
     Belgium

73,
John WB2OSZ

Ramsey, to my knowledge, STILL hasn't come out with his 220 version of
that radio has he?

A friend of mine asked me to post this message for him.
He's looking for Atari 520 STF software to drive a PK232.
Any help and information would be apreciated.
(reference, price, name of a store that can ship it maybe
even to France, etc.)

You can either reply to me, or send him a fax at:
          +33 - 16 - 94 30 66 87

10th ARRL Amateur Radio
Computer Networking Conference
27-29 September 1991
Radisson Airport Hotel
San Jose, CA

The Northern California Packet Association (NCPA) is hosting this year's ARRL Computer Networking Conference and invites you to attend. Glenn Tenney, AA6ER, is the local conference chairperson.

Hams from around the world will be presenting papers on what they're working on in packet radio. The presentations and papers might cover any subject from satellites to spread spectrum, from protocols to hardware, or any other topic related to how hams are, or will be networking

In addition to the usual presentation of papers all day Saturday, this year's conference will be surrounded by other intersting and informative activities. See the agenda inside to see what we have planned for Friday and Sunday. You won't want to miss any of this. Send in the attached registration right now.

How to Register for the Conference

Please use the attached conference pre-registration form to register for the tutorials, main conference, and the dinners. We are working with a VERY tight budget and would appreciate receiving your registration and check at the

earliest possible date. We have already had to make quite a commitment to the hotel, and catering is asking for a commitment which requires a close attendance count. Make your checks payable to "Fantasia Systems Inc." and mail them to AA6ER at: Glenn Tenney, AA6ER; Fantasia Systems Inc.; 2111 Ensenada Way; San Mateo, CA 94403 (the address is also on the form).

Hotel Reservations

We've arranged an attractive room rate of $69 per night, plus tax, for single or double occupancy. There may, or may not still be rooms available at that rate. You'll have to make your hotel reservations early as the number of rooms blocked out for us is limited. Call the Radisson Hotel directly at (800) 333-3333 to make your reservation. You'll need to tell them your reservation is for the "ARRL CNC" to access our block of rooms. The way hotels work, it will help us meet our budget if our block of rooms is used up.

Transportation

The conference hotel is located near to the San Jose International airport which supports both commercial and general aircraft. The Radisson Hotel offers shuttle service to and from the airport. Be sure to ask about the shuttle service when you make your hotel reservation.

In an effort to save you money, we've selected American Airlines as the official airline for the conference. What this means is that you can receive discount air fares (eg. from within the U.S., 5% off the lowest published applicable fare). You'll have to contact American Airlines directly for details. Call their Meeting Services Desk at (800) 433-1790 and refer to Star #S47Z14A. Since San Jose is an American Airlines' hub, you should find it very convenient.

The Agenda

Here's the agenda as it stands as of 11 September:

Friday, 27 September

13:00 - 17:00: In-Depth Tutorials

In addition to the two tutorials running in parallel described below, we hope to also have a third parallel tutorial on packet satellites, but this is not confirmed yet.

(A) Spread Spectrum Hints and Kinks for the 1990's Ham

by Randy Roberts, KC6YJY

Mr. Roberts has more than twenty-five years of ham radio, electronics, engineering experience and achievements over a broad range of technologies, systems and applications as an analyst, innovator, planner and designer. Mr.

Roberts has specialized in the design, development, test, analysis and simulation of spread spectrum communication and navigation systems, including software, RF, analog and digital hardware. Mr. Roberts' career includes employment at Hughes Aircraft, Management Research Laboratory, Linkabit, GRE America and Decom Systems. He designed the GS14, a 45/60 MHz 5 Mbps BPSK/QPSK modem for the U.JS. Air Force. He lead development on a 68008 controlled multi- mode frequency synthesized dynamic wide-range receiver, numerous direct sequence and frequency hopping spread spectrum systems including PLRS and JTIDS (which were actually used during Desert Storm) with chip rates to 60 Mbps and data rates from 1K to 10Mbps. Mr. Roberts is currently Chief Engineer of Senses/SSDC, a commercial manufacturer of FCC part 15 spread spectrum radio equipment and systems. Mr. Roberts holds a BSEE from UC Irvine and has done graduate work at UC San Diego and UC Santa Barbara.

Session Summary: Recent commercial developments and a new FCC Special Temporary Authority (STA) provide a renewed impetus to the amateur community to make more use of spread spectrum techniques. In light of the possible awakening of a ham spread spectrum community, this session is dedicated to providing some new ideas and some new insights into what can be done with modern spread spectrum techniques. This session will explain what spread spectrum is, what it does, what benefits it provides, and exactly how today's hams might make use of it. A major emphasis of this session will be to provide a solid basis of understanding of the theory of spread spectrum as well as covering practical details of implementation in a "hints and kinks" style that may help hams with an experimental urge to effectively conquer some of the hurdles that must be faced when building spread spectrum gear. A commercial unit (for FCC part 15, 915 MHz use) currently under development will be briefly described and demonstrated.

(B) The Essentials of Digital Signal Processing (DSP) Before You Begin Experimenting

by Matthew Johnson, KI6WA

Mr. Johnson is president of Sabaki Engineering, a software consulting firm specializing in custom software for specialized hardware in many fields of electrical engineering, including various DSP applications. Over the last eight years, Mr. Johnson has designed, implemented, and debugged custom systems including analog and digital telecommunications, high-speed high-volume data acquisition, robust user interfaces, signal detection, 2D graphics and process control. Mr. Johnson holds a BA in Mathematics from Reed College. His honors thesis included applications to coding theory (i.e. error correcting codes).

Session Outline: Definition of signal processing with examples; Definition of digital signal processing with examples (eg. filtering to improve SNR, modulation/demodulation, compression/decompression); Central mathematics required (eg. Laplace transforms, Fourier transforms, auto-correlation/cross-correlation and Wiener-Khinchin theorem); Sampling theorem (eg. Nyquist limit); Deterministic signals (eg. time/frequency domain, derivation of criteria for distortionless transmission); Linear filters (eg. impulse response, Duhamel superposition integral, frequency response, matched filter

as an example of maximum likelihood signal detection); Digital filters (eg. impulse response, step response, z-transforms, discrete Fourier transforms, classifications IIR, FIR, Minimum phase and linear phase); Effects of digital filters on random signals (eg. evaluation of round-off noise power for FIR and IIR, calculation of SNR of an ADPCM coder); Implementation issues (eg. memory vs. performance, accumulation of roundoff errors); DSP processor architectures (eg. of various architectures and programming models); Audio DSP applications in amateur radio (eg. use of matched filters for RTTY reception, use of median filter to remove impulse noise).

17:00 - 18:30 No-host bar

18:30 - 21:00 Dinner

Instead of everyone trying to find a pizza place that can handle fifty or a couple of hundred people, we've decided to have a very special group dinner. As an option you can sign up for the Friday evening dinner and join everyone for a LUAU! Yes, a real honest to goodness luau! This should be an ideal time for everyone to relax. We expect that most of you will join us, even if you aren't attending the tutorials. This will be right at the hotel, so you won't have to drive anywhere.

21:00 - 24:00 Birds-of-a-Feather (BOF) sessions

Saturday, 28 September, The CNC itself.

08:30 - 17:00 Presentation of CNC Papers

This is the traditional part of the conference. As in past years we'll be gathering up all of the papers submitted for presentation, and divide them into the time available. Everyone will have a chance to present a paper. The published proceedings and lunch (at noon) are included in the conference fee as are a mid-morning and mid-afternoon break.

17:00 - 18:30 No-host bar

18:30 - 20:00 Banquet dinner
20:00 - 21:00 Scheduled special banquet speaker:
Dr. Thomas P. Stanley, Chief Engineer, Federal Communications Commission

Dr. Stanley has served as Chief Engineer of the FCC and Chief of the Office of Engineering and Technology since February 1986. He has served in a number of other positions in the Office of Engineering and Technology (formerly the Office of Science and Technology) since joining the FCC in 1981. Those positions include Chief Scientist, Deputy Chief Scientist, and Chief of the OST, Technical Planning staff.

From October 1982 until June 1983, Dr. Stanley served as Assistant for National Security Telecommunications, to assist the FCC Defense Commissioner. Prior to his work with the FCC, he was affiliated with the Institute for Defense Analyses, the U.JS. Army Signal Corps, and Bell Telephone Laboratories.

Dr. Stanley received his Ph.D. and M.A. in Electrical Engineering from Princeton University and his B.E.S. in Electrical Engineering from Johns Hopkins University.

21:00 - 24:00 Birds-of-a-Feather (BOF) sessions

Ten or fifteen minutes per paper really isn't enough, so we've planned break-out rooms for "Birds Of a Feather" sessions. During the day we'll have sign-up sheets so that discussion groups can form and really get into topics of greatest interest.

Sunday, 29 September:

As usual, the digital committee will have their business meeting Sunday morning from 09:00 until 12:00. But that's not all... at no cost to hams and prospective hams:

10:00 - 13:00 Demonstrations, exhibits, and perhaps vendors

10:00 - 12:00 Packet Beginner tutorials
(A) Larry Kenney, WB9LOZ, the Vice President of the NCPA will present a beginner's introduction of packet radio. This will help you get started in amateur packet operation. Larry established the W6PW-3 packet BBS in 1986 and continues to be its primary sysop. Larry is the author of the popular tutorial "Introduction to Packet Radio" and has taught many ham radio classes.

(B) A beginner's tutorial is planned on getting up and running with TCP/IP.

12:00 - 14:00 Tutorial and a Meeting (no cost to hams and prospective hams)

(A) A beginner's tutorial is planned on getting started on using packet satellites.

(B) The NCPA is hosting a meeting of Northern California packet BBS SYSOPs.

The demo/exhibit room and newcomer tutorials will be open to all hams and prospective hams whether signed up for the rest of the conference or not.

And finally, the San Jose Technology Center is a short light-rail ride away and they have a fantastic high-tech museum called The Garage. Although a trip to the garage isn't an official part of the CNC, we're sure a large group will be planning a visit on Sunday. We'll try to help plan this outing during the conference. We'll likely work out a late morning trip and an early afternoon trip.

I am interested in starting a packet radio station at home, but really
only if I can access Internet mail and, less importantly, USENET. What
I need to know is whether this is feasible in the Cambridge area, and,
if so, how?

I'd still be interested in packet radio even if I cannot get access to
the wider networks. What can be done with it locally?

Currently I have no computer, no radio, no licence: what will I need?

Please reply by E-mail as I do cannot read rec.radio.amateur.packet
directly.

Thanks for your time.

(several hundred lines deleted :-)

Most of them go out very near the first of the month. I have been in
E-mail contact with Steve Schallehn, who writes the packet FAQ's. He says he
has been busy with the startup of school and all, but promises the next
edition very soon now, hopefully sometime this month.

In the meantime, the current versions of all the above documents can
be obtained via anonymous FTP from ftp.cs.buffalo.edu under subdirectory
/pub/ham-radio. Read file README for a descriptive index.

If you have any further specific questions not answered by the above,
please don't hesitate to send me E-mail.

Good luck!

73, Paul W. Schleck, KD3FU

I'm thinking of setting up a packet radio station here in Cambridge,
UK.

Suppose I had a 386 PC. Is is possible to do without a TNC and use a
PC board and a MINIX device driver with software instead? Does the
hardware and software exist already? Where can I get it from?

Please respong by E-mail as I cannot read rec.radio.*. I will post a
summary of responses if I receive anything interesting.

Thanks.

Ok, I'm quite certain that I will be laughed off the net over the next several days, but...

Why cant I just take my 9600 telebit, and interface it to my radio via an audio xformer and go screaming off at 9600 baud.

Issues like full duplex will probably be the first thing that get in my way, but couldnt I operate with a separate recvr (a cheap scanner comes to mind).

just checking

Hi, all of you senior,

I am interested in using the packet-radio to do remote control a device which have a RS-232C port.

Here are my questions:

1) Is there commercial package for doing such a thing?
2) If NOT, where can I find the resource to dig in.
3) If I use the remote control package which used in the phone line modem as a front end of TNC, does it work?

I am just a new comer in the packet world. Maybe the questions above is so silly. But, if you have any comment for me, please E-mail me, for I realy want to know the possibility to do a remote control via packet-radio.

Daniel

Check on the Simtel-20 archives (wsmr-simtel20.army.mil?) or one of its mirrors (like wuarchive.wustl.edu? i think?) in the directory pd1:<msdos.packet>.
Check the group comp.sys.ibmpc.archives for some more info.

I will not laugh at you. I once thought the same thing. (I haven't tested yet,
though)

I think a conventional FM transmitter/receiver will do it. Legal issues still
remain, though. (Who can decode the strange modulation of Telebit PEP only by
eavesdropping?)

I just received the following advice about this in email, which may
not compare to doing it all with a $3 chip, but might be useful if you
really need to do it in software:

[begin quote]
[...] if there's any kind of time or
space constraint, a much cheaper approach to FSK decoding is to
use a Goertzel single-frequency DFT. See Oppenheim and
Schafer's _Discrete Time Signal Processing_ for details.
(Actually, there are even better techniques, but this one is
good enough, and well explained in the text.)
[end quote]

One site for PMP is helios.tn.cornell.edu (128.84.241.2). According to the "brochure", there's also a mail server:"send a mail message with the subject "help" and a single message line "help" to ftpmail@decwrl.dec.com."

I'm not familiar with the Telebit, but I suspect there are two major problems. One is that a phone line is inherently full-duplex, either end can transmit to the other at any time. A standard FM radio signal is half-duplex, you have to have some sort of protocol organised to decide which end transmits, and when to change. Most modern two-wire modems aren't programmed for that, at the very least you'd need some way for the modem to control the PTT via RTS/CTS or something. A full-duplex FM set (eg 2m/70cm type) might cope though.

Secondly, the high speed modems use the phase of the signal to carry most
of their information. When they first establish communication they do some
rapid measuring on the phone line & adjust various internal filters to accomodate
the characteristics of the line, this is also monitored during the period of
connection. I doubt if the audio circuitry between Mike input & FM modulator
(and between discriminator & speaker on the receive side) in a standard radio
would maintain the phase info sufficiently accurately. Most 9600 modems for Ham
use have to connect directly to the FM modulator stage and FM discriminator in the
transceiver to get accurate control. Even so I suspect a modem that is
intended for use on a phone line would not be able to cope with the signal
variations introduced on a radio link. They may not be audible in speech but I
bet they'd screw up data comms.

As it happens, I heard from the authors themselves! It can be found on
their machine - helios.tn.cornell.edu [128.84.241.2] in /pub. Last I
looked, version 1.1 was there, superseding 1.0. Other sites also carry
it, but the above would be best.

97.69 (c) In addition to the above provisions, the use of any digital
code is permitted on frequencies above 50 Mhz, except those on which
only A1 emission is permitted...

It's legal. Now how to make it work. The Telebit requires a duplex
circuit so it can execute it's training sequence. If you nail up
a full duplex voice grade circuit, cross band duplex is easiest
since you won't need a sophisticated duplexer, then two Trailblazers
will train and communicate just like they do over the phone. You
will need a two wire to four wire hybrid between the modem and the
transmitter and receiver. Most of the newer dual band radios should
work just fine.

You will have to ID every 10 minutes using either CW or voice when
using a non-standard code. This will probably make the modems have
to retrain.

TAPR has it, and I cannot think of the name of it. Check with TAPR
I have also seen (i think) kantronics has a remote weather node.
basically a TNC with the processor talking to some weather monitoring
stuff.

>   3) If I use the remote control package which used in the
>   phone line modem as a front end of TNC, does it
>   work?
It would depend on the software. I have setup my TNC to act "just like" a phone
modem, so people (mostly me) can login to my Unix system.

No questions are too silly (well `what is the square root of -2' might be silly
or maybe not be appropriate for this group). The more people that get into
packet radio, the more unique and useful ways people will use packet radio.

How about if we missed the 73 issue, and the library in this town
don't see fit to carry it?

 Answer to Packet-Radio Digest v91 #221
 ************************************************************************

 Subject: PTM 4.27 and all the new versions!
 To:   N9CGD, Tom - and all others with the same interest for PTM-program.
 From: OZ4ZK, Kurt Pedersen
 Date: 15-Sep-91

 I am glad, you liked my program (PTM).
 As you can see, it is not the first version, and it is not the last one.
 I am sorry, that you don't have the manual for this version, but not all
 the versions are supported with an english doc-file.
 The latest version 4.44 & 4.45 are with english manuals.
 4.27 is already old 'over here'. I make a new version almost ones a week,
 so if you have found some bugs, they maybe gone in this version.
 PTM was born for nearly 2 years ago, and I can proudly say, that this
 Packet-Program is very popular i Denmark, some part of Sweden, Germany and
 England.

 Summary of PTM ver.4.45 functions:
 ************************************
 *** A = ALT   C = Ctrl   S = Shift ***
 ************************************

 F1      Handle Ctrl or Break for Command-mode.
 AF1     Show LOG-file.
 CF1     Make password-table.

>

I have read talk of using the so called Part-15 rules to operate low
power somewhere in the 900mHz band. Evidently this is an anything-goes
band as long as you limit the transmit power to something very low
(1w perhaps?). Part-15 is a kind of "citizens band", ie. no FCC
license required.

Spread spectrum might work well for this. I've also read that in some
parts of the country there is *lots* of RF noise pollution in this
band.

As to the availablilty of radio equipment for this, I don't know
anything specific, and I would be interested in read other's comments
about it.

This is a follow up to a previous posting of mine which read:

> I'm thinking of setting up a packet radio station here in
> Cambridge, UK.
>
> Suppose I had a 386 PC. Is is possible to do without a TNC and use
> a PC board and a MINIX device driver with software instead? Does
> the hardware and software exist already? Where can I get it from?
>
> Please respong by E-mail as I cannot read rec.radio.*. I will post
> a summary of responses if I receive anything interesting.

I haven't had a lot of response to this, other than to say ``Tell me if you get any information.''. There seems to be quite a bit of interest, but no previous work.

Having learned a bit more about packet radio I think it is probably a good idea to have a TNC after all. The strain placed on MINIX by a large number of interrupts from a dumb modem chip would probably prevent the machine from running anything else at the same time; this is one of the main reasons for using MINIX in the first place.

However, I don't think I want a full-function TNC, just a PC board which will send and receive individual packets (and cause an interrupt when they arrive). I don't want a mailbox, routeing software, or anything else built in.

I beleive that KA9Q NOS is often run with something called a KISS TNC which is fairly minimal. Could someone send me details or explain?

I'd be most interested in a minimal TNC and modem on a single small PC board (I wouldn't mind building it). The setup would then be:

- a 386 PC
- a TNC/modem board
- a radio
- software

The last of these may be the most difficult. I would need AX.25 and also TCP/IP. I understand that KA9Q NOS is an implementation of TCP/IP over AX.25. Is this true? If it is, then I want to get KA9Q NOS running under MINIX, with appropriate stitching between it and my TNC device driver. That's as much as I know, so here are some questions:

1. How easy is it to write a device driver for the TNC/modem described above?

2. How easy would it be to get KA9Q NOS to talk to a custom TNC device
   of this sort?

3. Who else is interested? Send me a message and I'll let you know how
   far I get. Bear in mind that I don't have much money (yet), I don't
   have a radio license (yet) and I don't have a computer (yet). All
   of these will appear if I can work out what I can do with the
   things.

Lastly, I'd like to know more about KA9Q NOS. Don't forget that I
can't read rec.radio.*, so I'd appreciate it if someone could E-mail
me a description of the services it provides.

Thanks for your time.

I downloaded NET Version 890421.1a sometime ago, and have only
now got it running on my UNIX Sys V machine. Is there a later
version of NET (or should I be running a UNIX variant of NOS?)

Any pointers would be appreciated..

No only would spread spectrum work, it is required if you want to
operate under the Part 15 rules that allow you to run 1 watt.
(Title 47 of the Code of Federal Regulations, Part 15, paragraph 15.247,
unless they've renumbered it since 1989).

Either your signal has to be 500 KHz wide, or you need hop to
at least 75 channels, 25 Khz apart (or more).

Bands are 902-928, 2400-2483.5, and 5725-5850 MHz.

>You will have to ID every 10 minutes using either CW or voice when
>using a non-standard code. ...

There is a good reason for this. Some years ago there was an unusual sort of splatter centered around 14.070 MHz. Sometimes it lasted a few seconds, sometimes for 15 minutes. It took a week of direction finding to locate the source. It was one of the first users of AMTOR. His signals were clean in every other mode. If a CW ID had been used (it was not required) someone could have given him a polite land-line call right away.

Hi all,
Does anybody know of a FTP site for WNOS, the main EXE file
apart from ucsd.edu / tomcat. Ive heard there is a beta version around
for WNOS....
Also on the subject of Nos has anybody got a problem with Bids from Nos
to the AX.25 world, again Ive heard WNOS is free of the Bid bugs...

The later really should go to TCP-Group, thanks ....

I'm running NET on my Sys V box. There is a minimal version of NOS
for Unix called nosnix. I've played with it briefly, but it lacks
some features needed locally for handling AX25 communications. There
may be a later version, but I'm not aware of it. NET is a real CPU
hog on my system and I could wish for better. Perhaps someone has
done a better job porting NOS to Unix. I'd love to hear about it.
I'd particularly like to hear from anyone who has done a device
driver for one of the 8530 cards under Sys V.

I am trying to set up a link between a modem, using a 64 kb/s synchronous
serial port (ie TTL CLK&DATA) and a PC (486). I will need to do packetising
of the data, and it occurs to me that AX25 may well be as good a method as any..

What I need to know is, how fast can the PC TNC cards go, and are there any
others apart from DRSI and PacComm. I have heard that 56 kb/s is possible
in the USA, how is this achieved ? And at what cost.

There are now several "wireless" ethernet adapters available, using both infrared light and radio. All of these would (I think) fail given the distance you need to use. Instead, why not look at packet? You will need a license of some kind to cover this distance anyway, and the hardware/software is already established. I am not suure whether you could meet your speed requirement over packet - perhaps one of th packet cognosenti could comment...

Packet will NOT use the bandwidth continuously (hams would never allow
this!) - the radio link is only used when data is actually being moved.

If you do the following in ioinit(), it will improve the CPU-hogness
a LOT. (I got this off the net soon after 890421.1 was released...)
Unfortunately, I've lost the original source, so can't give diffs...

```
------------part of sys5_io.c--------------------------
/* Called at startup time to set up console I/O, memory heap */
ioinit()
{
     struct termio ttybuf;
     extern int iostop();

     (void) signal(SIGHUP, iostop);
     (void) signal(SIGINT, iostop);
     (void) signal(SIGQUIT, iostop);
     (void) signal(SIGTERM, iostop);

     ioctl(0, TCGETA, &ttybuf);
     savecon = ttybuf;

     ttybuf.c_iflag &= ~IXON;
```

```
     ttybuf.c_lflag &= ~(ICANON|ISIG|ECHO);
     ttybuf.c_cc[VTIME] = 1 ; /* '\0'; */
     ttybuf.c_cc[VMIN] = 0; /* '\01'; */
     if ((savettyfl = fcntl(0, F_GETFL, 0)) == -1) {
          perror("Could not read console flags");
          return -1;
     }
     /* fcntl(0, F_SETFL, savettyfl | O_NDELAY); */

     ioctl(0, TCSETAW, &ttybuf);
}
```

The change is to VTIME/VMIN, and not using NDELAY. BTW - the fact that net logs you off whenever it dies is true for any program that sets vmin to 0 and/or uses ndelay - the shell does a read and gets 0 back (because there isn't anything to read), and interprets it as EOF.

Wayne, n1cit would like to put a 3rd (and 4th) port on his 386 that he uses for tcp/ip. What is a good solution? Is the AST board supported in net and/or nos? I think I remember that the Quadram 5 port card was supported under net but I thought it was a special case.

Did anyone go back and allow the general solution of interrupt sharing in the net/nos code?

Please send me e-mail on this. Lately, my net access has been shaky at best. If there is interest, I will summarize.

I'm relatively new to amateur radio: got my ticket over a year and a half ago, but I've been out of the country for most of the intervening period, so I haven't had much practice all told.

Today I picked up the first ham gear I can call my own: a Yaesu FT-470 HT and an AEA PK-88 packet controller. Here's what I would like to ask any helpful net amateurs who have experience with this or similar setups:

1. Does anyone have the exact wiring specifications for the Yaesu side of the cable to the TNC? Is "where do I plug it in" a stupid question? Presumably the MIC and EAR jacks, but how is the MIC jack configured -- if it's (as the manual specifies) a 2-conductor micro-mini phone jack, then what do I do with the PTT signal? Or is there something else I should know? I can wire the cable all right, but I have no appetite for blindly trying configurations on an expensive piece of equipment. Do I have to open the unit up?

2. Suppose I want to run the HT off a 12V external power supply. Where do I feed the power? Not the battery terminals, I hope. I would have expected a DC power jack somewhere on the unit, but again I don't see anything except a mysterious looking rubber plug-which-might-hide-a-jack-but-I'm-afraid-to-pull-it-and-look. The manual, again, says nothing about this.

3. Anything else (useful modifications, hints, caveats) I should know about the FT-470 (or PK-88?)

Thanks in advance for any advice given this slightly bemused new ham (I consider myself competent in analog and digital electronics, but faced with an expensive micro-miniature powerhouse like this thing, my main instincts are "HANDS OFF UNTIL YOU KNOW WHAT YOU ARE DOING!")

I'm trying to write a handout for an "Introduction to TCP/IP"

talk this weekend, and I'd like to include information on how
folks can get various versions of the KA9Q package.

The best current information I have on the Amiga version is
that it's being handled by John Heaton in England. But I haven't
been able to track down an address for him (email or postal),
his callsign, or any anonymous FTP sites for the code. (Don't
bother suggesting the University of Maryland; Louis Mamakos
isn't involved in the project any more.)

So...does anyone have definitive information on how Amiga
owners could obtain the code? Is it on any current versions of
those FISH disks? (Or at least, are the older FISH disks that
carry it still available?) Available via anonymous FTP? Available
via mail??

Thanks!
Patty

There is currently some controversy in the UK as to whether the correct
distribution for bulletins going to the whole world is @ WW or @ WWW. I was
under the impression that the latter (@ WWW) was correct, but apparently
@ WW is used widely in Europe. Is there anything written down anywhere about
which is correct (I know - silly question!)? What is the rest of the world
using?

Lines: 20

I have got a Heath Pocket-Packet HK-21. It is equipped with a TAPR-like
software and a mini-bbs (or mailbox), but unfortunately it seems not to
have the capability of the "KISS TNC" mode.

Neither trying out a series of commands ("kiss" etc.) nor the disassembling
of the ROM-contents (and search after "kiss") did help. But the manual
says on Page 4-42 about the PP (PPERSIST ON/OFF) command:

    "PPERSIST may be used in both KISS TNC and normal AX.25 operation."
                                  ^^^^^^^^

So the KISS TNC mode must be somewhere... Are there differend ROM versions?
Is there any further information about the Pocket-Packet? Here in Germany
I am sitting far away from the manufacturer Heath... Any pointers would
be appreciated.

The FT470 is wired like an Icom. You connect the audio from the TNC
to the tip of the mike plug through a capacitor and connect the PTT

to the tip with a resistor. The Icoms and Yaesus use a "leaky ground"
to generate PTT. The problem with this approach is there is a tradeoff
between rapid PTT and audio level and response. Typical values are
.1 ufd and 2.2 k ohms. The RC time constant limits TR turnaround.

A better scheme is to use a tiny audio transformer sideways like so,

You can rip a suitable transformer out of an old transistor radio or
buy one from Radio Shack.

>says nothing about this.

The 2 meter only model does have a power jack under the rubber plug, but
the 470 doesn't. There's a place on the board for one, but Yaesu recomends
that you use a PA-6 module instead. This is a module that mounts in place
of the battery and contains regulators for running the radio and charging
a battery connected to the bottom of the PA-6. This is a really nice
accessory and well worth the price.

>3. Anything else (useful modifications, hints, caveats) I should know
>about the FT-470 (or PK-88?)

Just the standard remarks that you should carefully set the audio level
so you wind up with a 3 khz deviation for your tones. Don't exceed that
level or many units will have trouble decoding your packets. Make sure
you have the power saver on the 470 turned off when you run packet or
you'll miss the first part of every packet. This can drive you nuts
because everything seems to be working but nothing prints.

One last note. Use a separate antenna and use shielded cables on your
TNC. Otherwise the RFI and RF feedback will ruin your packet operation.

Subject: Amateurs on USENET List
Message-ID: <1991Sep29.061823.17740@ve6mgs.uucp>
Date: 29 Sep 91 06:18:23 GMT
References: <1991Sep2.054309.15187@ve6mgs.uucp>
Organization: Amateur Packet Radio E-mail Gateway VE6MGS
Lines: 1229
Xref: gmdzi rec.radio.amateur.misc:4996047 rec.radio.amateur.packet:1205
Supercedes: <1991Sep2.054309.15187@ve6mgs.uucp>

I operate a gateway for USENET articles to the local Packet Bulletin Boards.
A side effect is that I am building a list of the amateurs on the Network. As
promised earlier, here is the list I've maintained. I would be pleased to take
any e-mail updates to this list.
Enjoy, 73 de VE6MGS/Mark -sk-
---------------------------It's been a slice-----------------------------------
Network address to name or call letters lookup table
#
Entries have this format:
Address   Call Name
#
Address Network address popularily used by individuals on the network.
Call   Call letters of the individual.
Name   Name of the individual. A trailing * denotes not searched in

```
#         call book for verification yet, @ means not found in call book.
#         ? after name means recheck (Call does not match name or other
#         discrepancy) may be required. If there are none of these, then
#         the address/call and name have been confirmed in the
#         callbook (1987).

Has anyone used the Icom IC-W2A for packet? How is the tnc interfaced to
the W2A (note that the W2A microphone connector is different than that used
in other icom products)?

Ok, I admit it was a bad example- maybe x-rated gifs would be legal to transmit. *I* won't be the one to test this idea. But the same question could be applied to something like the 1-900 message on packet:

what if a buisness related message was mailed to a person who had an account on some internet machine was read by that person while he had a telnet session into his internet computer from his amateur packet station? I am of the oppinion (at this point anyway) that the amateur has now comitted a violation of part 97 since HE was the control operator and knew that the posibility existed that something illegal could be put on the air through his actions.

It would be the same as the autopatch example- you COULD order a pizza though a repeater autopatch, but no one would do that (right- I've heard it done myself once.) You might also check your answering machine at home- not a buisness related action and completely leagl- but in doing so what if someone left an offer to buy something from you and included the price they would pay? Now you have violated the rules. You should not have taked the chance that this message would not have been there, but who is now responsible?

The answer is not that the person should not have called because answering machine messages would be third party traffic- if this were true then ANY call to a house with an answering machine would become a violation when the outgoing announcement began to play (its a recording- a message- NOT a real person, thus it is third-party)

just my 2 cents

>Al, my copy of the rules says part 97.115 prohibits the transmission of
>music. Could you post the quoted sections. I know I need to get a new
>copy of the rules.

>Automatic transmission of third party traffic is legal in repeater and
>auxiliary service. The described operation could be considered auxiliary
>service.

Actually it is not legal, as I understand it. Whenever third-party
traffic is being sent (i.e. autopatch operation), the repeater control
operator is supposed to be on duty. This puts the repeater in "remote"

control, not "automatic" control. Yes, I know this rule is violated
all the time.

I posted these a few days ago, but once again:

97.109 Station control.
...
(e) No station may be automatically controlled while
     transmitting third-party communications, except a station
     retransmitting digital packet radio communications on the 6 m
     and shorter wavelength bands. ... The retransmitted messages
     must originate at a station that is being locally or
     remotely controlled.

97.105 Third party communications.

(a) An amateur station may transmit messages for a third party to:
     (1) Any station within the jurisdiction of the United States.
     (2) [Countries that have a third-party agreement with the U.S.]
(b) The third party may participate in stating the message where:
     (1) The control operator is at the control point and is
      continuously monitoring and supervising the third party's
      participation; and
     (2) [The third party is not an ex-ham with revoked license]
...

<Editorial comment:>

Legalities aside, I am a bit nervous about setting up an Internet-
to-packet gateway that allows anyone who claims an amateur license
to originate messages. I would be a lot happier if there were
some sort of checking system set up with passwords for those
with confirmed licenses.

I have a local ham friend with an Amiga 500 that is hoping to buy a PK-88 or something at this weekend's ARRL National Convention in Saginaw, & he was wondering if there's any decent Amiga packet software (preferrably shareware) out there.

I'd appreciate any sources.

> Maine.

   Oh, God, no, no, no, a thousand times NO! I thought we'd sorted this one out long ago. Is W3IWI suggesting that all fields in a hierarchical address have to be unique? There are only 676 2-letter combinations: there must be more than that number of states, provinces and so on throughout the world (somebody else pointed this out before). Here in Western Australia we were forced to use #WA.AUS.OC, allegedly because the US had already flogged WA as an abbreviation for Washington state. My point was, and still is, that WA.AUS.OC is clearly a different address (routing hint, call it what you will) to WA.US.NA, and any software which thinks that they're the same is clearly brain-damaged. Do we have to start the left-right scan vs. right-left scan wars again?

I would agree that a wide-open gateway might be risky. The risks of a
gateway can be mitigated in two ways:
(1) packets to/from net 44 are not going to be routed over the Internet
in general. {though local sites *can* get connected}.
(2) My approach is to use a modified KA9Q that allows me to reject/allow
particular sites & services thru filters. I can get the functionality
and still only allow trusted/verified sites through. I'm not sure passwords
are more secure.

Cheers,
 Willis

Can any of you tell me where I might obtain a copy of the source
for the Amiga version of KA9Q NOS. I don't have FTP access so BBSs or
some other method would be best.

Thanks

Gary

...
I recently downloaded PK232COM.ARC, a shareware program written by
Joe Kasser, G3ZCZ. Its version is 1.41 with the lastest file dates
being in August 1987.
- Is this the latest known version of this software?
- Are there other suggestions/recommendations for software to use with
a recent vintage AEA PK232 box?

Any advice would be appreciated. I find that using vanilla PROCOMM+ V2
just does not cut the mustard - especially when changing modes from packet
to AMTOR to RTTY frequently.

got my PMP modem working! It works great. There are a couple things missing
in the 73 article, and some other information I got from Kevin Feeney that
really made it easy.

Imagine, in just a few hours (depending on where you get your parts), and a
little poking around, you too can be on packet radio for ~$50!

Not being a net guru, I'm not sure what "net 44" means. Also, what is the
definition of a "site"? If it means what I think it does, than the "site"
that I am using right now has a couple hundred users, most of whom are
not hams. How would you, for example, allow me to send messages to the
packet gateway without also allowing all the others running terminals on
this same computer?

Dr. (X)YL/OM,

I wonder if it would be possible to use a VAX/VMS type computer (not with
UNIX unfortunately, but DCL) and some sort of VT-type terminal for Packet
Radio. Right now I use a PC with PCPAKRAT and a PK232MBX but that is not

available all the time. Any VT-terminal can be easily installed on the
LAN but how do I go on from there? What TNC would you recommend, the
PK232MBX is needed for other things too so I have to get another anyhow.
I'd also want to use TCP/IP or such to enable automatic mail forwarding.
Would you know if there is software for that and how I can get it?

Please send your answer to PI5DD @ PI8JYL.NLD.EU

I am wanting to setup my TNC so I can lok into my Un*x systems at home.

I have seen all these BBS programs, and they seem harder to use than a
Un*x system, but have similiar features (mail, files, etc), and thought
just setup a small Un*x system, and let everyone join in.

One problem I keep running into is the TNC, and getty go round and round.
Last night broadcast over the standard Packet freq was **CONNECTED** about
40 times.

I tried transparent mode, this didn't seem to send anything, I tried turning
everything (CR, ECHO, etc) off in the TNC, but cmd: couldn't be shut off.
Is anyone doing this? Is this a bad idea? Any ideas?

Thanks

I've been playing with the Mac version of NOS. I have yet to get it to do anything useful. I've approached the setup from how my stuff is at home, but no luck. For example, the Mac will accept a hostname (it's an ASCII string, anyway.) But when I attempt to give it it's IP address, it replies 'unknown host'. Yes, I have a "Host.Net" file. The entries are in the format

        host.<TAB>i.p.add.ress

Is this correct?

The other problem I have is setting up the interface. The Mac has an Ethernet card using the MacTCP driver. What is the attach command?

If someone has successfully implemented NetMAC, would you please share your setup info with me? Any and all help will be greatly appreciated!!!

Net people;

I recently purchased a KAM and hooked it up to my rigs. I've got a few questions. SOme are probably FAQ others most definately not.

1) My VHF rig is a Kenwood 631. I've currently got the kam outputs and so forth running thru an 8 pole switch into the mic. No problems. The output of the rig is connected to the audio in of the kam thru the mini plug on the back. I'd like to hook the audio in to the KAM thru the mic plug. Before I irreversibly cut the plug off the kam lead and find that I have to pad the output of the 631 into the kam - does it work? Do I need to pad the 631 output? If so is the match critical?

2) On a similar note I have the HF port of the kam hooked to the 13 pin DIN of my Kenwood 440. THe audio input and output are running thru the DIN rather

than the mic and speaker out or the AFSK in and out. Here's the catch.
Packet on HF comes thru the KAM fine. But, I can't get RTTY or anything else
working. I get junk character on the screen in response to RTTY. I've
trieddifferent shifts speeds, modes, tones, very careful tuning, everything
I can think of. ANy thoughts? Padding on the output thats needed for RTTY
but not Packet? Note that the CW mode of the KAM works. Kamtronics tech
dept indicated they've heard of no level problems with the 631 or 440.

3) I'm a unix/SUn type hacker. I see lots of news about addresses and
TCP/IP etc on packet. I've got hte Gateway to Packet book and been watching
the nets and poking around on the BBS before I really get active. My question
here is two fold. I read about a TCP/IP package on the AT from W9A0 (I can't
remember the call right now). It's public domain - I think. Where can I FTP
it from? Will it run on a Zenith Z-248? What FTP sites can I search for other
tidbits? If I do get the drivers will my NCSA version of telnet on the PC
work with this?   Do I need to get my own IP address? I see lots of news
about the real internet and gateways. Can I FTP to my own Suns and Macs on
internet?

4) Here`s a real tickler. Minix and packet radio? Anything going on here?
Drivers? Utils?

5) On a more question - Are there sites for getting useful amateur radio
software for PCs and Macs. I'd really like a Mac based log etc.

I'd like to get involved in the development of more advanced user interfaces and
other aspects of the amatuer software world. I've got 8 years and
c/c++ oops skills. Who is douing what?

Well locally we do it a little differently. We use a DOS box running KA9Q
to handle the radio and feed the ethernet into the Unix box. Works great.
You can telnet into the Unix box and log in or you can FTP files in or out.
You can also access mail via SMTP. Poor old link level only AX25 users
can access the Unix box through the bbs gateway feature of KA9Q.

If you just want to use a straight TNC, try wiring your cable to use
the TNC CD line to assert DTR on the Unix box while setting echo off
on the TNC. This should get rid of the cmd: being echoed by your system.
A new getty will be spawned for each connect session.

Folks,
As many of you may know, the WA4ONG packet node site took a direct
lightning hit on Aug 3. It struck the Diamond 220 base vertical that was
top-mounted on my 180 foot tower. The antenna vaporized (I saw it!). Among
the damage were all the radios. I had been using ICOM IC-x8A/H radios, and was
quite pleased with them. I had 2 IC-28H, 2 IC-38a, and 1 IC-48a. As you know,
ICOM no longer makes these models, and also no longer makes any 220 radios.

So, I must pick new radios. I understand that Kenwood is the only vendor to offer 220. I also understand that the TNC connection to thier radios is kludgy. I would prefer to stick with a single vendor/series, so the cables and levels are all the same, but I don't have much Kenwood experience.

Any and all suggestions welcome!

I have a couple of questions for you guys out there. Can I send mail from this site to a Ham Radio Operator who has a account on one of the local packet radio sites? Is there a gateway for internet/packet radio?

The other question is I have heard someting about a no code radio license can anyone go into more detail about this? Can a person with a n code license use packet radio? And what is the maximum speed of packet radio?

I think you're getting confused by the DNS-style domain files. The old
hosts.net file should look like:

i.p.add.ress host [alternate-name]

Ex:
44.56.4.58 n1fmk.ampr.org n1fmk

> The other problem I have is setting up the interface. The Mac has an Ethernet
> card using the MacTCP driver. What is the attach command?

There should be an example of this in the autoexec.net file of the latest
NetMac distribution in: apple.com:/pub/ham-radio/

Hello OM,

I just read your note about NET/Mac, the NOS version for the Mac...

I did not know a NOS version was already available for the Mac...
If the program you were referring to indeed was NET/Mac, then I must say
that it's NET, not NOS!

If it is NET/Mac, then the format of the 'hosts.net' file is

i.p.add.ress<TAB>host

and definitely not the other way around!

Maybe that helps.

Huh? A new getty will handle tearing all the AX.25 streams apart? Not
quite. This setup might work (providing the ***CONNECTED message is
suppresed), but only one conenction will be allowed at a time.

Running KA9Q software will require all the remote users to run KA9Q
or similar/compatible tcpip based software. I think one could right
a small bbs program on unix that allows folks to "log in". The program
would need to talk to the tnc in either command mode or host mode.
With the kantronics kam (with 4.0 rom) you can talk to it in host mode
and get multiple conencts without having to do all the work of ax.25
(that is still done in the tnc).

Amateur radio packet TCP/IP stations have an IP address. The addresses
are of the form 44.xx.yy.zz, where the xx & yy & zz vary according to locale
and your station. {Brian Kantor is the overall administrator}.
"net 44" means those IP addresses than begin with 44; basically all IP packet
amateurs.

|> definition of a "site"? If it means what I think it does, than the "site"
|> that I am using right now has a couple hundred users, most of whom are

|> packet gateway without also allowing all the others running terminals on
|> this same computer?

Your interpretation of site is correct -- a (one) computer. If there are
multiple users on the same computer, then all could get through if any one
could. My kind of security is best for (a) access to Internet resources
from an amateur station and (b) single user systems owned by amateurs on the
Internet.

Cheers,
 Willis

ANNUAL FALL HAMFEST

Saturday October 12, 1991
8:00 AM till 2:00 PM
Rain or Shine

To be held at:

FARLEIGH DICKINSON UNIVERSITY
Teaneck, New Jersey

Featuring

Amateur Testing
Novice thru extra
8:00 AM to 10:00 AM Only

Exam information - contact Pete K2MHP (201) 796-6622
(No calls after 10 PM)

Bring Original FCC License and a photo-copy
VEC charge $5.25

$2.00 ADMISSION

.XYL and Harmonics FREE
.Lots of Parking
.Rest Room Facilities
.Refreshments

Talk-in on 146.19/79 & 146.52 simplex

Hamfest Information - contact Jim Joyce K2ZO (201) 664-6725
(No calls after 10 PM)
286 Ridgewood Blvd. No.
Washington Twp., N.J. 07675

Tailgate only sellers $8.00 / space
Bring your own Tables

Directions:

From the West....

Take Garden State Parkway to exit 161 (Route 4 EAST).
Take route 4 East to RIVER ROAD - FARLEIGH DICKINSON exit.
follow signs to parking area.

From NYC ....

Take George Washington Bridge to N.J.
take Route 4 West to RIVER ROAD - FARLEIGH DICKINSON exit.
follow signs to parking area.

KA9Q NOS BBS allows AX25 users to telnet out. You have to allow it
in the FTPUSERS file. The syntax for the user is simple,
te <your.unix.host>

Carl.

A new getty will be spawned for each new connection *provided* that the
TNC is used in single connect mode. If you allow multiple connections
to the TNC, getty will never see them past the first one. Once getty
sees a connection via DCD going true, it spawns a login which then spawns
a shell. Getty doesn't stick around. I didn't think I'd have to explain
this as it should be obvious to any Unix programmer.

>Running KA9Q software will require all the remote users to run KA9Q
>or similar/compatible tcpip based software. I think one could right

This is not true. KA9Q supports simple connect level AX25 sessions as
well as the more capable TCP/IP sessions. Multiple sessions are handled
quite naturally thru the KISS TNC. No getty is used in this case because
KA9Q manages the sessions by spawning daughter processes as required.

>a small bbs program on unix that allows folks to "log in". The program

This is harder than it needs to be. Just use the W2XO bbs code running
under KA9Q. Dealing with user mode or even host mode TNC interfaces is
obsolete. Running the TNC in KISS mode allows the programmer intimate
control of the packet streams.

NetMac works quite well. The latest version is 2.2 and includes a new version
of BM. The setup is dependent however on what version you are using. Please
indicate the version (or better yet get version 2.2) and perhaps I can try
to assist.

I am at the moment on a location away from my Mac, but I seem to recall
that in my hosts.net there is the letter   A   between the hostname
and the ip-address. I think the A refers to the type of binding between
the two items. Also the hosts.net file is in my system folder.

About the attach for Ethernet/MacTCP I am as curious as you are.
I tried whatever I though sensible, but to no avail.

I know a fellow HAM who is interested in getting into
packet radio using a Commadore 64. I've seen reference
to the C-64 Digicom modem which I think would do this.

Could anyone provide information describing the Digicom
cartridge and its availability? I would appreciate it
if you could point me towards information concerning
other C-64 packet peripherals as well.

Thanks,
Bill Plymale - KD4CIY

    I recently got the C-64 packet kit from Ramsey. I have had
    a few trials and tribulations getting it working, but last
    night it finally worked.

    One problem that I have is that I do not know anything about
    packet. The directions are no help, and the help software
    only tells you the features of the modem. I am completely
    in the dark. But it does work well. It is definately a
    cheap way to get into the game.

    Now if I can just figure out.............

I recently ran across this packet terminal software, and like it a lot
(althoughthere are a few bugs...). Does anyone know if there is a later version? How
about a manual in English? Funny: I have never seen it mentioned here!

          Tom, N9CGD

Hallo OM,s.
I have problems with the installations of Nos on my AT.
The Autoexec.Nos will be reading right, but no conversation
with the seriall port will go.
At this time i can not connect over the Loopback.
Please can me help someone.
Here is my Autoexec.nos

```
in case someone can find a error or wrong parameters.
please send answers to DC2SF @DB0LX via AX25
OR 44.130.57.2 thanks in advance.

I've been looking through reviews of these things, and they all sound the
same: "This is a really neat radio, with a few minor drawbacks."  So I thought
I'd ask for owner opinions.  Apologies in advance if this has just been asked
by somebody else...my net news connection has been scrambled for weeks.

What I'm looking for is a 144/440 MHz mobile with 25 W or more output.
I'm not that interested in bells and whistles, brand loyalty, etc.  Primarily
I'd like to know about:

* Reliability
* Receive sensitivity, particularly out of the ham band.  I'd like to be able
  to listen above and below the ham allocations for some work-related
  monitoring.
* Packet useability - ease of hookup (standard connector, documented pinouts)
  and signal quality/duty cycle capability with your basic AFSK radio modems.

One brand I'm not personally familiar with, Alinco, got some positive reviews.
In particular, one of their 2m rigs was highly touted in one review for its
packet performance due to its "true FM" design.  Any comments?

Thanks in advance for any suggestions...

Don  KL7JIQ

I am (for the most part) completely unfamiliar with packet radio,
although i suspect it'd come in handy on the field projects
(anthropology & archaeology) that i work on...

...is there a FAQ posting here? If not, is a primer on packet-radio
available via anonymous FTP? Any help in this regard is most appreciated...

Somebody just said that

interfacing to a tnc in host-mode is obsolete ;)
Anyhow I'd like to try it, but AEA's manual does'n contain
anything about host-mode.
Index says that chapter 6 is about host-mode,
but when I page to this chapter, it's about troubleshooting !?!

I know the general rules about "\x01\x40CON0CALL\x17",
but any help is appreciated.

    What do you mean 'that doesnt count ;-)' ? At least a wink was shown
    here. It counted for me... I've got U2MIR and U5MIR worked from the
    MIR space station. Now if only the sarex shuttle flights had a higher
    inclination!

> Its exciting for the astronauts because not only can they send data files
> back and forth and send their mission reports in while still on the mission,

> back down to White Sands, New Mexico TDRSS (Tracking and Data Relay Satellite
> System).
>
    Blah...Blah...Blah

    I left mail on MIR from my own home...no gateways...no satellite
    links...just me and my TNC.

I have upload the lastest version of the f6fbb multiuser,multilanguage
BBS on tomcat. The files are in the bbs/f6fbb directory . they consist
of a zip archive of each disk of the distribution.

This BBS allows compressed forwarding to reduce the bandwidth. Both
french and english documentation are in the files.

Sometimes, it is frustrating to be sysop at a amateur radio BBS. One reason
for this is that too many of the messages which are flowing through the network
are of no interest for us. Many of these messages have lost their actuality
because they have circulated through the BBSes for too long time. The news
become old news after a while.

I have some suggestions:

(1) The date and time field in the message header should reflect the time

the message was actually written, not the time it arrived to the local BBS system.

Many BBS-programs automatically kill old messages after a while. It is possible to specify time-to-live for messages and even to differentiate between different types of messages. If the "time-out" was based on the actual write-time as mentioned above, it would help a lot.

(2) A step further is to associate a time-to-live attribute to each message which is forwarded with it through the network. This attribute could be specified by the message-author or automatically assigned by the system. (I think THE BOX implemented this feature some years ago).

Any opinions/comments?

Just wanted to put out a general query for anyone who is currently running the NOS encap, axip, or the SUN ax25ip code AND is not already known to the 'gateways' mail group. If you are running such a system and want to hook up with the other Internet/packet gateways, please contact us by sending a message to gateways@uhm.ampr.org. Do NOT reply to this Usenet newsgroup.

   I've purchased the KCT board without the Tuner option. Now I want to
upgrade. Is there anyone with the Tuner option installed, that could
tell me what IC's and other components I should add to the card (there
are empty places for IC's), in order to enable the Tuner features?

A couple of SysOps here in Australia were also wondering how such a scheme could be implemented. Presently most BBS packages look at the date the message was originated and if it is older than a certain date they put the bulletin on hold for sysops to review to see if it is still relevent. This helps to some extent but is abused by some BBS's in being set far too long.

I would like to put forward a proposal for an addition to the BBS system where a User (if he/she desires) can put a lifetime on a bulletin they send out. This could be done partly by adding some code to the user interface to ask if the user wishes to specify a lifetime (with the sysop setting a limit in the code so the facility wouldnt be abused) and then letting other BBS's know what the original lifetime desired was by including it in the BBS HEADER of the ORIGINATING BBS Only. This could take the form of an L:number field being added to the BBS header OF THE ORIGINATING BBS, eg..

Subject of message here
R:910101/1234z @:AB1CDB.ETC #:56887
R:910101/1223Z @:ZX5EDC.ETC.SO.ON #:1235 L:3   <- ORIGINATING BBS HEADER

text of message goes here

The L says if you get this message and it is older than 3 days after the date in the originating BBS header then Mark it as fully forwarded and dont forward it to any other BBS.

This then gives users a means of specifying lifetimes and stop things like Solar Forecast Bulletins originated in Europe appearing on the Australian BBS Network a week or two after!

To stop users seting lifetimes to ridiculously large numbers, have the existing old bulletin detecting mechanism remain and act as a ceiling value on a lifetime.

I know several of the BBS authors read this news group, I would be interested in their thoughts on this. I know it would take a while to implement but if it was introduced it would surely become more effective as it was included in more of the BBS packages and sysops upgraded to new code.

Comments most welcome...

P.S. Did you know, that FBB BBS has gained great popularity in Europe
  because it can do compressed forward, handle large amount of active
  messages without memory probles (and use EMS or XMS memory to speed
  up message retrieval) and has user selectable support for 15 languages
  included?

I would like to know if it's possible to convert a file of presumably 6-bit
RTTY to plain-text. If it is, how do you do it? I've been looking in the
ARRL Handbook, and am not entirely sure what I'm doing. Has anyone ever done

this (I'm sure SOMEONE has...) Any and all help will be appreciated!

I am looking for the ka9q NOSNET software for use with an Atari MegaSTE
computer. I read in a certain magazine that it was available for this
machine from Mike Curtis, WD6EHR in Hollywood CA. and sent him a request
for information including return postage. That was some 3 months back and
still nothing has been heard. That's enough time for even a slow mail boat
to get downunder, so now I'm trying quicker methods.
Is it available for ftp? Is anyone using the ka9q software on an ST?
Should I buy a Macintosh LC and go that way?
Any guidance appreciated.

Thanks in advance....

David...

If it's encrypted in 5 letter groups you can just use standard forms of
cryptographic attack. If you have enough of the material and they aren't
using a one time pad, you should eventually be able to break it. If it's
not in 5 letter groups, it should be much more susceptable to attack.

Amateurs are forbidden to use codes and cyphers, so if it's an amateur
message you are trying to decode, it should already be in plain text.

If on the other hand you mean that you want to translate plain text
encoded in Baudot to ASCII encoding, then the solution is relatively
painless. There is a two to one correspondence between Baudot and upper
case ASCII. You must keep track of the letters and figures shift characters
in order to determine which lookup table you should use for translation
of any given character. The tables are in the Handbook.

The 10th ARRL Computer Networking Conference will be held Friday, 27 September and run through Sunday, 29 September 1991 at the Radisson Airport Hotel, right in the heart of Silicon Valley.

The Northern California Packet Association (NCPA) is proud to be the sponsor this year of THE premier Amateur Radio Computer Networking event! And this 10th "CNC" is going to be the best Packet Radio Conference yet!

This is one of 3 messages describing the events planned for each of the three days. This message details Friday's activities.

Friday, 27 September 1991

1300-1700 Pacific Time

This CNC will feature something never done before at any CNC: In-Depth Tutorials on cutting-edge Amateur Radio Technology! If you attend seminars as part of your work, you know that they can catapult your understanding of complex ideas.

Three concurrent Tutorials will be offered from 1300-1700 on Friday. They are:

1. Digital Signal Processing

2. Spread Spectrum for the Amateur and Part 15.247 Spread Spectrum

3. Packet Radio Satellites, present and future

Although I'm sure you'd like to attend all of the Tutorials, time only permits us to offer these concurrently, so you'll have to pick the one you most want to attend.

The speakers are those that are on the Leading Edge of technology, and are entertaining as well! These sessions will be right down to the bits and bytes level, and each session will include handouts.

The sessions will start at 1300 so that East Cost and Midwest Packeteers can conveniently fly out Friday morning and be at the Radisson in time for the tutorials; the 3-hour time difference between the East Cost and California makes this a true convenience.

1900-2130 Pacific Time

Dinner. But not your _ordinary_ dinner! Instead of finding a pizza place that can handle fifty or a hundred people, we've planned a special group dinner. Come down and join everybody for a LUAU! Yes, that's right, a true honest-to-goodness luau! Even if you're not planning to attend the tutorials, you'll probably want to come to this event, as it will be held right at the Radisson, so you won't have to drive anywhere (actually, with the San Jose Light Rail system, you may not have to drive at all!).

After dinner, we expect to have some informal "BOF" (like in "Birds of a Feather Flock Together") sessions.

And, of course, we won't tantalize you any more than we have to about how beautiful Norther California and the Valley are...

You won't want to miss this one! For further information, contact the ARRL or the conference organizer, Glenn Tenney, AA6ER at:

Glenn Tenney, AA6ER
Fantasia Systems
2111 Ensenada Way
San Mateo, California 94403
Voice: 415/574-3420
FAX: 415/574-0546
Ham BBS: AA6ER @ K3MC.#NOCAL.CA.USA.NA
UUCP/Internet: tenney@well.sf.ca.us
CompuServe: 70641,23

He can give you more information and costs for the various events.

So mark these dates on your calendars: September 27, 28, and 29, and plan on being in San Jose at the best Computer Networking Conference ever!

Hope to see you there!

-Mike K3MC

Lines: 20
Nntp-Posting-Host: 128.171.11.17

The following problem has been noticed on both a PK-88 and a PK-232 TNC.

When a user sends a message to the mailbox on these TNCs, the TNC will accept
a '/ex' at the end of the message properly if the /ex is in a packet by itself.
However, if the /ex is included in a packet with the preceding part of the
message, the AEA TNCs will not recognize it and continue to wait for more
lines in the message.

This prevents the mailbox in NOS from forwarding messages properly to AEA TNCs.
NOS piggybacks the /ex onto the last packet of the message for efficiency and
this works with other mailboxes EXCEPT for the AEA TNCs.

Is there some parameter on the PK-88 or PK-232 to allow it to accept the /ex
piggybacked onto the last packet of a message?

Or, is there an EPROM firmware fix that solves this problem?

Is there a program around - or even available books - that give detailed
information on how to break the 5 letter groups of letters found on many
HF RTTY trasmissions ? Who is sending these messages (they are outside the

amateur band) and how secure are they ? (compared to DES or RSA encryption)
Has anyone actually seen the programs that convert standard text to 5 letter
groups ?
Any info is appreciated.
73,
Rich

 Sb: PK-232 BATTERY

The debate on the battery in the PK-232 is interesting. The problem is if
you like to run different software then you are going to have some
problems. The manual indicates that you should disconnect the jumper
in order to by-pass the battery since it's not needed when running
the PCPAKRATT software. That's because the software upon booting loads
the parameters on to the PK-232.

However if you decide that you would like to use another program, then
you'll find that you need the battery in the circuit in order to
preserve the parameters in the TNC memory.

So the solution is to place a jumper with two leads in the battery circuit
and place a mini switch in the back of the PK-232 (there's plenty of room)
This will allow you to place the battery in and out of the circuit
as necessary. this is nothing new. I wrote a similar message on the
BBS's about 3 years ago, but there seems to be some interest on this
topic by new owners of the TNC.

Five letter groups generally mean you are dealing with a cypher rather

than a code. Systems in use range from various rotor machines to the
classic one time pads. A one time pad is theoretically unbreakable,
unlike DES or RSA which are merely "computationally difficult" to break.
One time pads require secure delivery of the pads and are generally
reserved for diplomatic traffic.

Two books that can serve as an introduction to this fasinating world
are "Codes and Cyphers" and "The Codebreakers".

I just put the "Data Engine" version of G8BPQ's Net/Rom clone, version 4.04
on TOMCAT. Although there have been several prior versions, this one is the
first that combines working documentation with reasonably bug-free (as opposed
to perfectly bug-free) code. It works well enough that I am running a
"production" switch with a Data Engine & 2 9600 baud modems attached via
"polled KISS" to 2 more TNC-2s with 4800 baud modems. The KISS interface is
running at 19200 baud. Look for the file DE404BPQ.ZIP in the G8BPQ directory.

BTW, this version eliminates the requirement for at least one 128k byte SRAM
in the Data Engine. You will need a 512k byte EPROM and considerable
patience trying to get the cover back on the Data Engine case :-)

rec.radio.amateur.packet:1114

[Follow-ups directed to news.groups and comp.protocols.misc (for those not
  willing to wade through news.groups)]

This is an official Request For Discussion for the creation of the
new newsgroup "comp.protocols.tcp-ip.ka9q"

Proposed Charter:

Comp.protocols.tcp-ip.ka9q would be for discussion of the configuration,
modification, extention and administration of the KA9Q NOS IP routing
software. This group is intended to cover both the "old NET" version and
the newer "NOS" version, as well as the various platforms it has been
ported to.

While there are existing groups which cover various elements of the KA9Q
package, it is the intention of this group, to gather together the vast
net-wide knowledge base into one area. Currently discussions about ka9q
are carried out in rec.radio.amateur.packet, comp.protocols.tcp-ip[.ibmpc],
comp.protocols.ppp as well as several mailing lists.

I would hope that this concentration of readers would aid in adding some
structure and coordination to the development of the package, as there are
currently many flavours of the system derived from varying previous versions.

Why "comp.protocols.tcp-ip.ka9q"?

ka9q's strength (IMHO) is its IP routing capabilities and secondly, its
built in TCP server support (SMTP, POP, finger, etc). These strengths
are applicable to many tcp-ip environments. While the software's roots

are based in amateur packet radio, its use is spreading rapidly into the
IP routing/briding/serving arena. rumor has it that this software is the
base of the Telebit Netblazer's OS.

ka9q supports the following protocols:

SLIP
PPP
SMTP
POP
bootp
RIP
ARP
FTP
telnet
ICMP

plus others

Discussion will end at 11:59 P.M. on 27 September 1991.

i will running the vote unless anyone has any objections.

Things to be aware of if building from the 73 article.

The W1/W2 jumper should be set to W1. W2 is for loopback testing, probably
not needed. I guess the editors edited this out.

On the big PC board parts layout, C3 is shown as a Jumper. This should be C3 not a jumper, otherwise audio will be poor.

The bias to pin 7 should be set to 2.75 volts if you have a newer chip. The older chips worked fine with 2.26 volts, I couldn't get mine to work below 2.7 volts.

Using PMPTEST, try for percentages around 0-5% on both. Negative percentages are normal (minimal 0-5%).

Kevin Feeney is real helpful.

Most of the real encrypted stuff is essentially unbreakable. There is
five-character-group traffic on weather nets, usually with some clear
text messages. These have headings containing lines like:

ZCZC
WXXX 5 KAWN

These follow standard formats and are not really encrypted. The "callsigns"
are really ICAO identifiers and some like KAWN are not actually airports.
KAWN is the U.S. Air Force Automated Weather Network (last know locataion
was Carswell AFB near Ft. Worth, Tx).

There are a lot of military RTTY signals using 850 or 170 Hz shift which
just appear as a jumble of characters. They are usually 75 baud with
a stop bit 1 unit long rather than 1.43 units.

I have just installed, (and paid for) the LAN-LINK shareware
from G3ZCZ. I am extremely pleased with this program. Among other
other things, it actually is well documented (128 pages).

Does anyone have experience with other programs from G3ZCZ,
I find a logger, contest program, CQSS simulator and WHATSON
a prop program listed for sale.

Anyone who is currently running an AP-LINK who could recommend
their software. The station has HF/UHF/VHF capability and
both a MAC and PC on line for other functions.

Thanks es 73

Re: DE404BPQ.ZIP on tomcat.gsfc.nasa.gov

Oops!  I fell into the "what is a binary file under VMS" trap and the
BPQ404DE.ZIP I uploaded has an extra pair of bytes every 512 bytes.  I
have again uploaded the file, although with a different name, BPQ404DE.ZIP,
and I have asked Tom Clark to delete the old file and change the name of
the new file.  Therefore, look for a file with "DE", "404", and "BPQ" in
the name with a date of 09/05, and all should be OK.  Perhaps sufficient
public embarrassment will prevent me from making *that* mistake again.

A group of local packeteers has started spreading ROSE switches from here
(Saskatoon,SK) down to Regina (164 miles SE). Nobody around here has made
any significant use of TCP/IP and all are just getting the hang of the
ROSE switch. One guy in Regina though is keen to use TCP/IP between the two
cities so the question is can TCP/IP be used through a ROSE network?

This year's ARRL Computer Networking Conference is being held in San Jose,
right in the heart of Silicon Valley. If, like me, you come from an area
where the state of the art in electronics parts houses is Radio Shack, a
trip to Silicon Valley can be quite overwhelming. There are many places
that you might want to visit, so I've prepared a list of them and
then a small review of those that I visited on my last trip.

I started out by collecting the Yellow Pages listings under Electronics
and Surplus and set out to visit as many of these places as possible.
I've organized this into two lists. The first is a listing by town
in counterclockwise order around the Bay and alphabetically by street
within each town. It contains almost every company that was listed in
the Yellow Pages. The second list reviews those places that I was able
to check out personally.

Caveat: These data were collected in October, 1990, so some places may
have moved or closed. Places that I have not visited may not even be
parts retailers. I intend to check out some more of them this year.

If anyone has any additions, deletions, or corrections to this list, I
would greatly appreciate them.

Besides the electronic parts houses, there are two other places worth
visiting, but I don't have the addresses handy. First is the
Exploratorium in San Francisco. This is a hands-on science museum that
is great fun. I spent two hours the last time and didn't get to see

even half of it, so I recommend allocating about five hours to see it all. Second is the Computer Literacy Bookstore. Any computer book you might ever want is here.

Have fun!

Mini-review of selected companies

A to Z Surplus, 980 S. Bascom Ave., San Jose
Test equipment and electromechanical surplus.

Ace 'Lectronics, 975 S. Bascom, San Jose
Surplus components, connectors, etc. Affiliated with Advanced Component Electronics

Advanced Component Electronics, 911 George, Santa Clara
Advanced Component Electronics, 3479 Kifer, Santa Clara
A nice supply of ICs, connectors etc.

Alltronics, 2300 Zanker Rd., San Jose
Mostly surplus parts and test equipment. Some unique items, such as electronic teddy bears and hamsters.

Anchor Electronics, 2040 Walsh Ave., Santa Clara
New parts, no surplus.

Arndt/Jameco, 1355 Shoreway Road, Belmont
Mainly a mail-order company. The showroom, if you could call it that, had a couple of their PC plug-in cards.

Consumer Scientific, Inc., 1411 El Camino Real West, Mt. View
Items for the amateur astronomer and home scientist.

Fry's, 541 Lakeside Dr., Sunnyvale
Fry's, 440 Mission Ct., Fremont
Fry's, 340 Portage Ave., Palo Alto
What can one say about Fry's? It could only exist in Silicon Valley and you've got to go there to experience it. All new computers, parts, tools, TV, stereo, books, food, and personal items. Literally one-stop shopping for your average hacker.

Haltek, 1062 Linda Vista, Mt. View
A very large assortment of new surplus parts, particularly resistors and capacitors. Some surplus test equipment and computer parts.

Halted Specialties (HSC), 3500 Ryder St., Santa Clara
A large assortment of parts, connectors and hardware, surplus and new.

Ham Radio Outlet, 2210 Livingston St., Oakland
Ham Radio Outlet, 999 Howard Ave., Burlingame
New and used ham radio gear.

J & H Outlet Store, 476 Industrial Way, San Carlos
Electronic and mechanical surplus. Metal stock.

JDR Micro Devices, 1256 S. Bascom Ave., San Jose
New PC-compatible boards and parts. I didn't see anything that wasn't in their magazine ads.

Al Lasher's Electronics, 1734 University Ave., Berkeley
New tools, parts and test equipment.

Lynn Johnson Electronics, 3480 The Alameda, San Jose
On each trip west, the days and hours seem to change, so I have yet to actually get in the place. They advertise in Nuts and Volts.

Mike Quinn Electronics, 1080 Langley (Oakland Airport), Oakland
     Now _this_ is a surplus store! Dirty, junk piled up to the
     ceiling, and aisles so close that you have to be careful not to
     knock things over. It was great! :-) While I was there, they
     were unloading a complete VAX-11/750 system.

Minute Man Electronics, 37292 Fremont Blvd., Fremont
     New tools, parts and test equipment.

Quement Electronics, 1000 S. Bascom Ave., San Jose
     New parts, tools, TV, stereo, and ham radio. Looks like it might
     have been a grocery store at one time. Prices are high, which is
     probably why I've heard them referred to as the "Bascom Bandit."

R & D Electronic Parts, 1432 S. Main, Milpitas
     New parts and tools.

Silicon Valley Surplus, 4222 E. 12th St., Oakland
     I didn't get in here, either. There was a sign saying "Drug Zone"
     in that block and a little further down, there was a drug bust in
     progress. That was too much culture shock for this Pittsburgh boy
     so I decided not to hang around.

Weird Stuff Warehouse/Computer Surplus Store, 715 Sycamore, Milpitas
     Good selection of new surplus connectors and ribbon cable. Lots
     of boards for various computers including an assortment of
     SASI/SCSI adapters. Used test equipment.

MSG # TR SIZE TO   FROM   @BBS   DATE   TITLE
13392 B# 2753 NETWRK W3IWI MDCBBS 910902 Networking in MD/DC area (Part 1)
Forwarding path: WB4D KA3T WA3ZNW W3IWI

Because of the Federally Mandated Spectrum Reduction Act ("FMSRA",
a.k.a "The UPS Subsidy") which today reduces the old 220-225 MHz band
by 40%, a major re-alignment of the area's packet resources has occurred.

The FMSRA follows on the heels of serious breakage of the network due
to lightning hits (WA4ONG, W3IWI) and multi-month power outages (the ELK
nodes at Elk Neck and the NAVY nodes in Annapolis).

This note will report on the network status as I understand it as of late
8/27 and will then digress into some ideas of what I think should be done.

(1) 220 MHz frequencies: At the July board meeting, the ARRL Directors
adopted an interim bandplan which shows digital activity as follows

223.40-223.50	Simplex (local option)
223.52-223.58	four 20 kHz packet channels
223.60-223.70	one 100 kHz wide high speed channel
223.72-223.78	four more 20 kHz packet channels

which was also adopted by the MD/DC coordinating council, TMARC with the
decision to reserve the 223.40-223.50 region for simplex FM voice.

North of here in the Philly/SEPA area, the repeater council permitted digital
activity in the 223.40-223.50 simplex region. The Philly-area folks
established their post-FMSRA 1200 BPS backbone to be on 223.44 and made
the move over the past several months.

To the south in Richmond, WA4ONG coordinated a 1.6 MHz-split repeater pair
222.92/224.52 with the intent of using the lower frequency for a dedicated
Richmond/DC link mated with nodes on the DCA "stack". As a result, the MD/DC
area LAN moved (almost en masse) from to 224.52 in the voice repeater band
lacking any other viable option. The 222.92/224.52 repeater pair is unused
in the DC area, but is reserved in the Philly for a (reportedly inactive)
voice repeater.

When ELK2:W3IWI-11 at Elk Neck, near the MD/DE border came back on-line last week, we put it on 223.44 as a way to extend the backbone from Philly.

With all these comments, here is what I understand to be the frequencies in use in the area in the 222-225 MHz band:

222.92: DCA/RIC link
223.40: W3INK BBS plus local simplex packet plus activity in SNJ
223.44: Philly area (several nodes) plus ELK2:W3IWI-11 plus WB3FFV-2
223.54: FDK2:N3EFC-2 in Frederick plus LANC1:KA3CNT-1 in Lancaster
223.66: Western PA links (including W3KDC near Cumberland)
224.52: DCA1:K3AF-1 plus BALT2:W3GXT-10 plus HOCO2:NB3P-2 plus many MD/DC BBSs

(continued in part 2)

*** END OF MSG # 13392 from W3IWI @ W3IWI.MD.USA.NOAM

MSG # TR SIZE TO   FROM   @BBS   DATE   TITLE
13393 B# 2041 NETWRK W3IWI MDCBBS 910902 Networking in MD/DC area (Part 2)
Forwarding path: WB4D KA3T WA3ZNW W3IWI

Continued .....

(2) Stations, broken and otherwise: Several of the broken stations have (sorta) returned to the air:

ELK: ELK:WB4APR-11 (145.01) and ELK2:W3IWI-11 (223.44) work about as well as they ever did, with special thanks to N3GIY and K3AKK. The ELK6 (6M) node hears a few of the 6M backbone stations occasionally but doesn't seem to be able to hold a connection. ELK70 (70cm) seems to be sick.

NAVY: WB4APR has managed to get power restored at the Annapolis site. From here it appears that NAVY (145.01) doesn't hear very well. NAVY6 (6M) status is unknown.

RICxx: WA4ONG is still struggling to get his system rebuilt and reports that the damage was over $6000! No reliable RF links between MD/DC and RIC exist. RICBBS is back online. W3IWI & WA4ONG are keeping the mail moving using non-amateur computer network connections.

W3IWI BBS: My lightning strike was not as severe as ONG's. All BBS ports are back online. All spare TNCs have been pressed into service and I have a pile of broken hulks. While ELK was down I moved my 145.01 port to 145.09 and have now QSYd back to 145.01. Summer HF conditions have been rotten!

(3) Link status: With all the nodes broken, and following the 220 MHz FMSRA 40% "tax", links to/from the MD/DC area are rather chaotic!

At present there is zero to poor connectivity between here and Philly, since ELK6/NAVY6/DCA8 link on 6M isn't healthy, and since ELK70 is nearly useless, and since there is no other link between 223.44 and the DC LAN.

The FDK2/LANC1(223.54) and FDK(145.09) LAN shows connectivity to the DCA nodes thru DCA3 and FDK4 although the link seems marginal to me.
(continued in part 3)

Continued .....

(4) The IMHO (IN MY HUMBLE OPINION) department (up on the soapbox!):

Joe, KD3DE and Doug, WA3DSP in the Philly area reports that the EASTNET backbone from Philly to New Haven, CT works at 9600 baud with good reliability and connectivity.

That network is made of several point-to-point links; each hop is on a different frequency from neighboring links. This is contrasted to our "super sites" which try to serve both the area LAN activity AND the long-haul backbone needs.

Carpe Diem! I suggest that we do our best to make lemonade from the 40% FMSRA lemon and restructure our activity. We need the DCA-like "superstations" to serve the user community, but now is the time to make the investment in QRM-free point-to-point backbone links to interconnect the user-based LANs.

Little 2-watt radios (the size of a cigarette pack) designed for 9600 BPS digital service on 70 cm are available off-the-shelf for < $200. Commercial radios (Motorola, GE, etc) are cheap and have been proven to work at 9600 BPS.

The modems are available off-the-shelf. TNC2s, Kantronics Data Engines or IBM-PC-clones running KA9Q software can move the bits around.

Even low power radios coupled with directional antennas can work 30-mile hops from average locations. The super-sites (like DCA) are great because the users can hear them well. But they tend to have problems hearing, both because they hear too much (the classic "hidden terminal" problem) and because these sites have lots of RFI from other users at the site.

The concept of LANs interconnected by a separate backbone works for cellular telephones. The concept of a digital network of interconnected LANs tied together by a redundant backbone works incredibly well (its called the Internet and it has 500,000+ hosts all around the world). The utility of a good backbone for amateur use has been demonstrated by the PA/NY/CT 9600 BPS links. Its not that we don't know what to do, we just haven't done it here in the Balto/Wash area.

IMHO, what is needed to make the network work includes:

- Some people who are dedicated to the problem who will devote some time to integrating off-the-shelf hardware and software widgets, to installing the hardware, and to maintaining it.

- Some good RF-quiet sites spaced 20-40 miles apart. Let's pick the I-95 corridor from Richmond to Philly as a candidate path.

- Some way to raise enough money to buy the widgets that can't be begged, borrowed, stolen or donated.

- Coordination of the links to make certain that it works efficiently.

- People who are willing to pat the "doers" on the head and convince them they are doing the right thing -- but they need to do more!

We have the genesis of this structure set up in the "DC Area Sysop Council" (DCASC). Once or twice a year the group gets together, everyone tells what they are doing, everyone says "Yea! Verily! Rah! Rah! Rah!", everyone goes home, and little happens. (Yes, I am as guilty as anyone!)

When all is said and done, a lot more has been said than done!

Does anyone else (users and sysops alike) feel as frustrated as I do? Have we yet reached the point when we decide its time to do something to fix the network (which I perceive to be badly broken) ?

Lets have some discussions on these issues. I really want to hear what others think.

73, Tom

Poke around the campus a bit. TAMU has a packet BBS and Kurt, WB5BBW,
is an expert on the subject. He works there and is on this net.

This comming Sunday the next...

***** 50 cent buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS

FLEA all SUMMER at MIT
Sunday, September 15th, 1991
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 400 sellers and free, off-street parking for >1000 cars!

Buyers admission is $1.50 (you get 50c off if you're lucky enough to have a copy of our add) and sellers spaces are $8.00-each at the gate or $5.00 if mailed by the preceding 5th. A sellers Season Pass for all 7 sundays is available for $28 if purchased by April 21st

The flea will be held at the corner of Albany and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

!! RAIN or SHINE !! Have no fear of rain, a covered tailgate area is available for all sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

I am trying to correspond regularly with someone in Louisiana.
Lately, I get his mail but he isn't getting mine. The condition
has persisted for several weeks (normal delivery is 2-4 days).

Are there any mechanisms to test/debug mail forwarding on a
system level? Something that would generate a reply to the
sender everytime the mail is forwarded to another node?
Something else that might be useful is a sucessful delivery
reply a la the postal return receit requested. There are
end-to-end protocols for reliable transmission. Have any
been implemented for this sort of high-level problem?

Thanks.
harold

writes...
>Can a person with a n code
>license use packet radio? And what is the maximum speed of packet radio?

See below, but yes you can use packet with the nocode ticket. Normal
packet gear is 1200 baud, some 2400 and 4800 baud modems are available,
which may or may not require mods to your radio. 9600 baud modem defacto
standards have been set, but usually require radio mods. Other modems are
available up to 56 Kbits/second, and I wouldn't be surprised to find
megabit or 10 megabit modems out there somewhere.

--------------Willie's FAQ------------------
The question frequently comes up: "How do I get my Technician class ticket
(the one that doesn't require code tests)?"

The simple answer: "Call the ARRL at (203) 666-1541 and ask for their
Prospective Ham Package. They will take your adress and send you the
package customized for your zip code. It's not the most impressive package
I've seen, but it gives you a list of VEs in your area as well as
information on "What is Ham Radio?" and "How do I become a Ham?" and all
that."

The other simple answer: "Call the W5YI Group at (800)669-W5YI and ask for
their licence preparation material. I haven't had any contact with the
W5YI Group, but I'm told you get your ticket a little earlier when you take
your test at a W5YI session."

The more complicated answer: "You need to pass the Novice and Technician
theory tests at a VE session in your area. Talk to local hams (if you can
find them), check out your local ham store (if you can find one), or call
the ARRL. To get the study guides for the above tests, call the ARRL,
check out your local ham store, or go to Radio Shack for their part numbers
62-2414 "Now You're Talking" or 62-2413 "Nocode Tech License Manual" or
(62-2410 "Novice Class License Preparation" AND 62-2411 "Technician Class

Manual"). The Novice book will from Radio Shack will include morse code practice tapes, and all of the Novice/Tech study guides will probably indicate that you need morse code for your Technician license, but don't panic! The FCC only recently changed the rules (as of February 15, 1991), but you don't need morse code for the Technician class ticket."

I am selling the following equipment which I bought half a year ago. If interested, please contact me. Only serious buyers please.

1. Sony ICF-2010 World Band Receiver
2. Sony AN-1 Active Wide Range Antenna
3. Passsport to WorldBand Radio 1990 (book)
4. Shortwave Directory (book)
5. World Radio & TV Handbook (book)

The entire package is for $530.00 .negotiable.

Hello,

I'll try pmp as soon as my parts arrive, but my real goal as someone who's
never tried packet is to use tcp/ip. I have a dos type computer but I would
prefer to use a non-intel (risc) workstation that I have.

Is this possible? What do I need?

Regards,
David

What kind of RISC workstation do you have? Chances are it runs UNIX

(probably the Berkeley UNIX dialect) which already supports TCP/IP.
This is what makes TCP/IP so powerful - almost everybody supports it,
so you don't have to reimplement the wheel yourself.

On the other hand, your workstation probably doesn't support the link
level protocols used in amateur packet radio. The easiest way to put
your workstation on the air is to get a small PC and put an Ethernet
card in it. (This assumes your workstation has Ethernet, which it almost
certainly does).

Either hook up the PC to a TNC or install a packet radio interface
card in it (e.g., DRSI). Then bring up my software on the PC and
configure it as an IP router between the Ethernet and packet radio
networks.

The beauty of this approach is that you can run your completely stock
workstation over the air. It needs to know nothing about amateur
radio. (This does assume you have a reasonably recent TCP
implementation in the workstation that knows how to deal with a path
as slow and unreliable as one that includes amateur packet radio
links...)

Please post for sale items in the rec.radio.swap newsgroup. That is what
it's for. It's terribly annoying to read inappropriate for sale messages
in all the other rec.radio newsgroups.
Tnx & 73

Netfolks:
 Imagine that someone is transmitting binary information to you
using audio frequency shift keying. One tone represents a binary 1,
another represents a 0. Well, I've got modems whose filters turn these
tones into a series of pulses (e.g., TTL), but I would like to try
the following (just for fun). I would like to digitize the audio with
my fancy digital oscilloscope, and decode the 1's and 0's from the
waveform using software on my PC. I have everything setup except for the
algorithm to look at a waveform (voltage vs. time) and convert it to the
1's and 0's. I'm familiar with Dr. Nyquist's regulations, etc., but it is
just not obvious how to approach this. What do you think?

I suppose you could look at the samples from the 'scope, and note the time
between zero-crossings, i.e. each time a sample goes from +v to -v. That
way the actual 'v' doesn't matter, nor does waveshape etc. The reciprocal of
the time between zero-crossings will give you the frequency. You'll need some
sort of averaging etc. in there but it shouldn't be too hard if its
only 300 or 1200 bps. A frequency above the average is a 1, below the
average is a 0. Its simplistic, and won't cope with noisy signals, but
might be a start. Or it might not work at all :-)

1. Take audio signal
2. Delay it
3. Multiply it by the non-delayed signal
4. Make an average (pass it through a low-pass filter)
5. Apply a threshold so you get 0s and 1s

Notes: The low-pass filter should have the cut-off freq.
       at around 3/4 baud rate (800 Hz for 1200 Baud)
       The delay: this depends on center frequency and deviation.
       I can't give you the right formula now... Send me your
       your signal's parameters and I find it for you...

Greetings!

I am attempting to convert a file (of which I assume to be RTTY) to
SOMETHING readable (which I assume to be plain text). To help explain, here's
a sample of the original file:

a:MaORl5\DI2>X1Hf\jO=9k5U>2[mJI__ZPBacJgg3f]4HoLf@Fhl?mWc0SkNJ (more and more)

I have coded a C program that extracts 5-bit values from the above stream, and
compares those values to Table 11 on page 19-19 of the 1990 ARRL Handbook. For
example, with an initial offset of 0, the program produces:

OWDFOHXL<FIGS>-6.+/"<SP><SP>)('/<BEL><BLANK>+/")8?.&<SP>./:0,6629)0064)6/
<LTRS>PSE<LF>OPFRBPMWBSHHLIXNB<SP>EIGIT<LTRS><FIGS>6/-,'/<BEL>!<BEL>/'2<SP><CR>4

from the above example snippet.

The program would of course produce different results with an initial offset, but it's all garbage anyway. Has anyone ever done this succesfully? If you're wondering, this data was captured by a Mac running AEA PakRATT hooked up to a TS-440 (I forgot the frequency.) I also assume that all data transmitted is present in the stream.

This began as an interesting diversion, but now IT'S DRIVING ME CRAZY!!! I would really like to see something useful come out of this, but if it's not possible to do, then I'm bailing out now before I waste much more time.

What help can you give? What about parity, start/stop bits, data loss, bit inversion before conversion? Any and ALL _explicit_, _detailed_ HELP will be greatly appreciated!!!

73 de KC4WEJ,
Derrick

I have recently acquired an AEA PK-235 interface unit. I am currently using

a rather poor terminal program on my Mac SE. Can anybody comment on MacRatt
sold by AEA? Are there any Mac programs out there (commercial or public
domain) which have been written for PK? How difficult is it to monitor

facimile transmissions on the screen of the mac. What is the recommended
software for this particular configuration? Any help is greatly appreciated.

Please post or E-mail to discipiow@willow.ulowell.edu

Thanks,
Bill DiScipio   -.. . WC1J

Greetings, again!

What is 6-bit RTTY? I assume it's a twist to 5-bit RTTY, but with different
translations and transmission schemes (i.e., start/stop bits, etc.) Does
anybody out there have a conversion table and/or a time sequence? Any and

all help will be greatly appreciated!!

73 de KC4WEJ,
Derrick

How about running the audio through an F/V chip first? that way you don't
have to look at the actual audio waveform with the FM encoded on it, but
rather only the changes in frequency instead (that's what you're really
after... isn't it?)

I wish to change our BBS's software from it's usual MBL 5.14
to the new FBB 5.13.
In doing so I would also like to have the PC-XT run APLINK at the same time
om HF. The catch is this:
Can I run FBB as the Packet side of APLINK and ignore the very limited
packet part of the APLINK software ? In other words - I'd like to
have the APLINK program talk to FBB instead of it's own packet side of the
software.
Any Suggestions ?
- Rich

>I have everything setup except for the
>algorithm to look at a waveform (voltage vs. time) and convert it to the
>1's and 0's.

You would use the Fast Fourier Transform algorithm (FFT) to convert
the data from the time domain (each data point is a measure of
amplitude at a point in time) to the frequency domain (each data point
is a measure of amplitude at a particular frequency). You apply the
FFT to chunks of data that occur over a long enough time interval
compared to the frequencies you are interested in so that the
measurements make sense, but sufficiently shorter than a bit so that
you get enough samples per bit. When you have a signal, the output of
the FFT should show most of the energy clustered around one of the two
frequencies used to represent 1 and 0. You apply a filter by throwing
away data points for frequencies that are too high or low.

There's a FFT program with C source available for anonymous ftp from
wsmr-simtel20.army.mil in pd:<msdos.c>fft142.zip, or from its mirror
archive on wuarchive.wustl.edu in /pub/mirrors/msdos/c/fft142.zip. The
latter was recently reported down with hardware problems, and
oak.oakland.edu was reported as available for anonymous ftp of the
archive until wuarchive comes back up.

Subject: 10th CNC agenda update as of 12 September
Message-ID: <27259@well.sf.ca.us>
Date: 13 Sep 91 08:03:27 GMT
Organization: Whole Earth 'Lectronic Link, Sausalito, CA
Lines: 42

10th ARRL Amateur Radio Computer Networking Conference
27-29 September 1991 at the Radisson Airport Hotel, San Jose, CA

Contact: Glenn Tenney, AA6ER
Voice: (415) 574-3420 Fax: (415) 574-0546
UUCP/Internet: tenney@well.sf.ca.us CompuServe: 70641,23

Here's the agenda as it stands as of 11 September:

Friday, 27 September
13:00 - 17:00: In-Depth Tutorials
(A) Spread Spectrum Hints and Kinks for the 1990's Ham
(B) The Essentials of Digital Signal Processing (DSP) Before You Begin Experimenting
(C) We're also planning a tutorial on packet satellites.
17:00 - 18:30 No-host bar
18:30 - 21:00 Dinner (a luau!)
21:00 - 24:00 Birds-of-a-Feather (BOF) sessions

Saturday, 28 September, The CNC itself.
08:30 - 17:00 Presentation of CNC Papers
This is the traditional part of the conference. As in past years we'll be gathering up all of the papers submitted for presentation, and divide them into the time available.
17:00 - 18:30 No-host bar
18:30 - 20:00 Banquet dinner
20:00 - 21:00 Scheduled special banquet speaker:
Dr. Thomas P. Stanley, Chief Engineer, Federal Communications Commission
21:00 - 24:00 Birds-of-a-Feather (BOF) sessions

Sunday, 29 September:
10:00 - 13:00 Demonstrations, exhibits, and perhaps vendors
10:00 - 12:00 (A) Beginner's introduction of packet radio.
(B) Getting up and running with TCP/IP.
12:00 - 14:00 (A) Getting started on using packet satellites.
(B) The NCPA is hosting a meeting of Northern California packet BBS SYSOPs.

The demo/exhibit room and newcomer tutorials will be open to all hams and prospective hams whether signed up for the rest of the conference or not. There is no cost to attend these Sunday events.

Saturday, 28 September, following the CNC, we have a special speaker scheduled for our concluding banquet:

Dr. Thomas P. Stanley, Chief Engineer, Federal Communications Commission

Dr. Stanley has served as Chief Engineer of the FCC and Chief of the Office of Engineering and Technology since February 1986. He has served in a number of other positions in the Office of Engineering and Technology (formerly the Office of Science and Technology) since joining the FCC in 1981. Those positions include Chief Scientist, Deputy Chief Scientist, and Chief of the OST, Technical Planning staff.

From October 1982 until June 1983, Dr. Stanley served as Assistant for National Security Telecommunications, to assist the FCC Defense Commissioner. Prior to his work with the FCC, he was affiliated with the Institute for Defense Analyses, the U.JS. Army Signal Corps, and Bell Telephone Laboratories.

Dr. Stanley received his Ph.D. and M.A. in Electrical Engineering from Princeton University and his B.E.S. in Electrical Engineering from Johns Hopkins University.

Just try to estimate the frequency changes in your signal.
This is as far as I know the way the MODME's are working. I didn't got
more information on this theme, but maybe it helps.

Best Regards

           Ralf, DD2KZ

Just do a FFT on the digital samples, now your input is in the frequency
domain and you can read out the 1s and 0s from the presence or absence of
the particular tone. This technique is the way many DSP implementations are
done and offers considerable noise immunity. It takes a fairly fast processor
or a DSP chip to do the FFT in real time. A 16 Mhz or faster 386 should be
able to do it.

You can also do a digital comb filter by summing the samples with themselves
through a digital delay (read the samples twice with a fixed offset on
the buffer addresses, the offset coupled with the sample rate will set the
comb filter frequency). Move an absolute value function over the output and
run a moving average function over this. This will give you a large number
when the tone is present and a small number when it is not. A simple comparator
function will now slice your data and give you ones and zeros.

Has anyone experimented with the source of TheNET to make it run in a datagram
mode and not a vitrual mode? It seems that if you want to cut down on frequency
congestion, why duplicate the process by waiting for an AX.25 ack then sending
another packet for the level 3 ack? Seems awful wasteful of band width. The

AX.25 level to end-user to node makes sense, but node to node? TCP\IP works quite nice with datagram mode UI frames, is a keck of faster and is a heck of a lot quieter. I am sure that new versions can be top down comapatable with older vitural nodes. I believe this is how ROSE does and it (and lord knows I hate ROSE!, but not not for that reason!)

I am no programer and don't claim to be. I am sure the guys in 7-land who have done a great job with the 2 series can come up with something, or may NORD><LINK? (what happened to them?)

I've tried to remain silent on this, but I think it's time to inject my comments.

First, my credentials: I ran W0RLI MailBoxes (Hank didn't want to call them BBSes) in the early days. I started when Hank and I lived 15 miles apart and the platform was the Xerox 820. There were chunks of my code in both the Z80 and PC C-compiler versions, maybe still are. My PBBS was the major NTS node for New England. (I stopped running a PBBS some years ago.) I have also been involved in Arpanet/Internet mail since the days when there were only about 6 nodes on the Arpanet and TENEX was the dominant operating system on the net. (I wrote the first FTP on the ARPAnet, which carried the mail before SMTP was invented.)

The basic problem is this: The "bbsnet" chose to implement an addressing scheme that LOOKS EXACTLY LIKE, but IS NOT, the Internet domain name system.

As soon as this mistake was made, those of us on the Internet yelled and screamed that it was a mistake. I personally yelled at Hank, and offered to give him whatever examples and standards and documentation he might want, to show him why it was a mistake. He seems to have forgotten this, (Sorry, Hank, but I did. We all forget things, me NOT excepted). At the time, he said, as he says now, that the two systems were different and therefore the similarity was unimportant. I was unable to convince him that it would be a problem.

The point was then, and is now, that two very different things look just the same. People (and programs, but mainly people) are SURE to occasionally get them confused. This COULD and SHOULD have been avoided by not making them look the same.

Changing the top-level domain (rightmost field) might temporarily eliminate the current conflicts, but it is again sure to not solve the problem. Name conflicts will appear in the future between these completely different, separately administered, yet identical-looking systems.

The correct fix is still the one that was suggested at day one: Make them LOOK different because they ARE different.

The most straightforward way to do this appears to be to have the

"bbsnet" operators and authors switch to a different separator,
such as ":" instead of "." between fields of the
name/routing-hint elements. Hank even said this would not be a
hard change, though he thinks it won't help. I believe it WILL
help a great deal, and in fact will solve the problem. The only
other colon-separated thing I know of that looks at all the same
is the Ethernet hardware address, and in that case all the fields
are two-digit hex numbers. Not much chance of confusion.

Change the PBBS software to DISPLAY addresses (hints) as
":"-separated, even if they arrive "."-separated, and to accept
(for a while) "."-separated addresses (hints), but immediately
change them to ":"-separated strings. Users WILL change, even
though they will grumble.

All the suggestions about ".ampr.org" and ".packet" are red herrings.
Even if they were adopted, they are still incorrect. The resulting
strings are NOT host names, as all the PBBS-authors agree. So they
shouldn't look like them.

The basic point, at the risk of repeating myself too often, is
that it was a serious mistake to make two things which are very
different look as though they are the same. The correct fix is
to make them look different. I believe it is much easier to
change the "bbsnet" addresses-cum-routing-hints than the
Internet's domain name system (consider all the commercial
vendors and turnkey systems).

I ask Hank and the other authors to PLEASE do this.

73,
Bob Clements, K1BC, clements@bbn.com

Despite what others are likely to tell you here on the net, it seems
clear that no messages should ever be transmitted on amateur radio
without being checked first by the amateur operator who first
transmits them.

"97.109 Station Control

Hank and a couple of others want to move this discussion
to the BBS network.

Two problems with this,

1. It will be painfully slow!

2. How do you propose to get the coverage of the entire world? Here
in Australia it is quite unusual to see ANY bulletins out of the USA.
We do see lots from Europe via AsiaNet BUT that can be upto a month old.

Before moving the current world wide discussion to the BBS net can we
agree to implement a bulletin designator that covers the whole world? At
least at the SysOp level? WW is used in Europe I noticed but WW doesnt
make it past the Europe><AsiaNet Gateways, and as I mentioned practically
nothing except AMSAT stuff makes it outside of the US.

Cheers de Grant VK5ZWI

[posted from packet]
[via WB5RZX @ WB5RZX.OK]

This past weekend I had a chance to work my friend Dan, WA3KZO, in one of one first IBM Digicom "BAYCOM" contacts in our area of PA. Most of us in NwPa use Digicom, and we were all wondering how the new program for the IBM would work. Well, as Dan said, the color on the clone he was using was "Dazzling!" Dan at my request, did the job of interfacing a Digicom board I had for my C-64, to test the program. After a few good hours of hand wiring away she went.

The idea of Baycom is the same as it is for Digicom. A software approch to Packet radio. You dont need a TNC. All you need is a small Modem that, in Baycom's case, converts the RS232 port to standard packet tones 1200/2200 HZ.

The board connects the radio to audio in, out and PTT. As most Digicom users know, Digicom works very well and in some cases has many more functions than do some well used packet programs.

Baycom is a good program from a user stand point. It doesn't have the sophistication of a Digicom V 3.51 as we use on the 64, but It is a great User program. You can send and receive programs to and from disc, store a message a friend may send to you, and generally use the program. Even your hard disc can be used for storage.

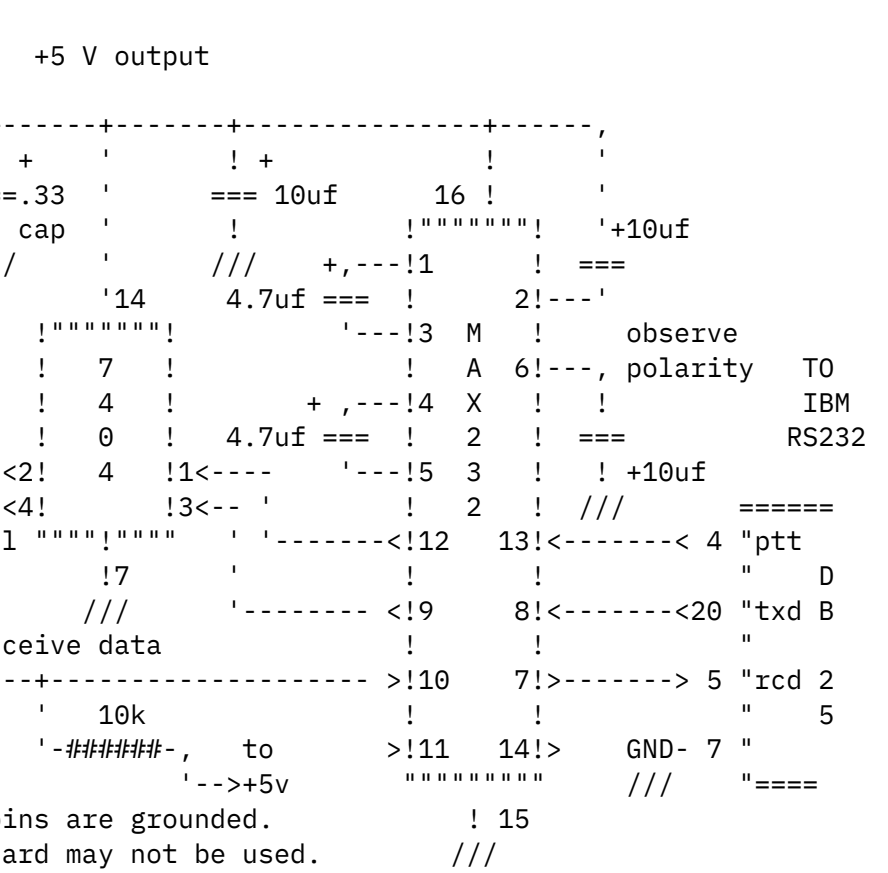
It has a fine presentation on the screen. The screen is divided into 3 sections; Top=transmit, Middle=receive, and bottom= a monitor Screen viewing all the activity on the channel. You see all the rr0's, Sabm, I frams, etc. on this screen. And yes if you have color, it Highlights all this info in different colors making it easy to follow just what is happening on the channel.

Our club, the Crawford Amateur Radio Society, was interested in seeing just how the Digicom boards could be interfaced to the IBM. Dan used a traditional method. Converting the RS232 level serial data to TTL level so it could be used with the 64 Digicom board. The board was one that uses the XR2206 and XR2211 chips.. In looking at the information that was sent with the program. There are many ways to do this job, Almost any Digicom board out there currently could be used with a few changes. Dan used the 1488,1489 approach.

We noticed that the program has remote commands as does Digicom. Remote commands are those sent by a connected station. Something Digicom has had since it inception. // is used for a remote command, but be aware some responses are returned in German. By the way, the same people that wrote Digicom, wrote Baycom as well. I'm sure in future upgrades this will be changed. The authors state, as with Digicom V1.52, that they started the ball rolling with Digicom in the US. Baycom 1.20 is in its infantcy also.

I think for the IBM user that wants to try someting new in packet, or for the new ham that just wants to expermint with packet, Baycom maybe somethng they want to try. Most Digicom modems are very inexpensive and can be converted for the IBM.

We will be sending more info on how to convert a Digicom board when we do a bit more expermenting. Our Club is trying to make it as easy as possible.



Baycom is a public domain program and can be found on some of the National BBS Telephone services. We dont want to name any here.

Crawford Amateur Radio Society is our local ham radio club.

IBM RS232 to C-64 DIGICOM MODEM

Well here it is Guys & and Gals! The interface you were waiting for! Crawford Amateur Radio Society member WA3KZO Dan is testing BAYCOM for the IBM and has come up with an interface that will allow you to use almost any C-64 Digicom board and your IBM using BAYCOM. The Chip used is a MAXIM MAX 232. This chip converts TTL level 5V signals to RS232 signals used by the IBM.

Here is the circuit:

I've AGAIN sent Hank a copy of most of the relevant RFCs for internet
mail, host operation, and domain naming, in the hopes that he'll read
them and learn something from them this time.

Directly applicable or not, there is a LOT of accumulated networking
wisdom in those documents. After all, they summarize the lessons
learned from 20 years of running a network that now spans the globe,
has more than a million hosts attached to it, and can reach an
estimated 20 million users.

Next to that, the ham BBSnet is tin cans and string. Let's see if we
can't make it better!

Hello everyone,

Two friends of mine from the Rutgers University amateur
radio club got me into this. They demonstrated to me
tcp/ip over ham-radio which impressed me. I would like
to get my own ham-radio license and they told me that
there existed a Hypercard stack on apple.com that covered
everything that I needed to know to get a license.

Unfortunately, the hypercard stack is not there anymore.
I ftp'ed to apple.com and looked into /pub/hamradio
but found nothing. Does anyone have this file or know
where I can grab it from.

Thanks for you help!

I haven't run a packet BBS in two years, but my recollection is that your
software does regular expression string matches on a text routing file
starting with most local match first. If that's false, then I'm in error
and apologize. I've seen comments about having to prepend a # in front
of local references in order to avoid confusion with top level names of
the same spelling. This reinforces my view that you aren't doing a recursive
descent right to left parsing of the name. Since I haven't seen the source
code, I don't really know what you are doing.

Hello Folks!

Regarding the current discussions about future changes in the PBBS routing
schemes, I have put a message into the EU packet net saying "US authors of
PBBSs want better cooperation with those in other countries".

This is one of the replies:

In Message <DB0SAO047625@bbs.net>,

I think it is rather typical for europeans, not to have internet access.
So could you please consider a way to inform your colleagues all over the
world or even better, let them take part in the discussion, via packet..?

73, Rolf

I think we need to stop mentioning solutions that are impractical.
These includes a change to the AX25 BBS address format.

Many of you are underestimating the inertia of trying to change the
AX25 BBS software. There isn't just one or two authors out there
anymore, there are about a hundred. We also have many systems running
old code (such as MBL) that no one really supports and we have a lot
of mailboxes that interface to the full service systems that are
running EPROM firmware. Do you really expect every PK-232 mailbox
owner to buy a new EPROM?

About the only thing we can do is come to a consensus on either
switching to W3IWI's proposal for 4 letter continent codes (.NOAM)
or adding something higher than the continent (.USA.NA.AX25PBBS)
If the BBS authors here on Internet and few other key players
get behind a new naming scheme, we may be able to make it work.

Hello everyone,

Thanks so much for all of your help. I've received all the information
that I need to get the hypercard stacks. Thanks to all of the below

John Woods - WB7EEL ; Dick Kriss - KD5VU
Jack Brindle - WA4FIB ; sidney markowitz
and
Antonio Querubin - who sent me Diana L. Syriac newsletter regarding
            her hypercardstacks.

One thing that I must say is that you people are very nice
and very helpfull. From the days when I was learning unix
and I asked question people would generally send me a RTFM
message and I was expecting something similar here. Thanks
for helping me out.

Hopefully, I can be a ham soon and set up an internet <-> amateur
gateway at rutgers with the help of Tim Hayes and Allan Baum.

This fall I will be working for Network Services at Rutgers University
in New Brunswick as a student systems programmer. At one point there
was some interest at Rutgers to become a gateway. I've read Warren
Toomey's document (very informative warren) and will present it to
Network Services this fall.

Here are just a few questions that I have:
Besides ka9q who used to be in NJ what are the gateways in NJ?

Does there exist a visual map (for the US would be good enough
for starters) that shows all of these gateways?

What other package besides the ka9q software exists to run tcp/ip
over ham? I heard about PA0GRI which is available from ucsd.edu.

Thanks,

Marc

While I support the proposal of switching to .NOAM as a 'quick fix' (and have implemented it locally), I also think the long-term solution is to make the addresses look SIGNIFICANTLY different. This would alert users to the fact that the addresses are used on different networks and therefore reduce the likelihood of mail bouncing or going to some black hole.

The best way to do this is to change the separator character from '.' to something else. Changing the separator wont increase the length of mail addresses.

The other proposed alternative (adding a higher-level domain name) doesn't necessarily add a whole lot more information to the address that a different separator could just as easily accomplish. Nor is it guaranteed that users will always tack on the extra name. The extra name also increases the length of the mail address and may result in a larger number of potential 'variations' in mail addresses that must be checked for and corrected at the gateways.

|> transmits them.

That looks correct to me, but doesn't completely answer the question on
internet<>AMPR gateways. Despite what some people are likely to say on
the net, there are more services than just mail.
Two issues: mail from non-AMPR to AMPR; other services (e.g., file
transfer, host logins) initiated from AMPR.

I would agree that general mail from non-AMPR networks cannot be
automagically transmitted (or gatewayed to a PBBS). What about mail
known to be created by amateurs? (Either thru a wormhole or by another
gateway).

Other services deserve to be discussed, since not everything is point to
point messages. What if I login to *my* non-AMPR host from my home station?

Potential network services are possibly more complex than those considered
when the rules were made, but I don't see how the rules forbid all those
services (except for the mail exception noted above).

Cheers,
 Willis n5szf

If changing to 4 letter continent codes will solve the problem, then that
would appear (to me, at least) to be the simplest solution. I would prefer
to avoid having to add something like .AX25PBBS, as that will just be so
much extra text for the majority of people. However, if it is decided that
that is the best way to solve the problem, then I will go along with it.

I will send out a bulletin in GBR tonight to let those people who haven't
got access to the Internet (the vast majority of UK packet users) know what
is being suggested and get their views. It might be worth one person in each
country doing a similar job.

Agree. I personally simply don't care what set of characters the
bbs net uses to identify continents. My software doesn't either.

The 'problem' arose because a small number of people who use
both the internet and the bbs net made a mistake when addressing
some messages. This will always occur ...

[
  Again - sorry for using non-standard format, but my editor does not
  allow for a simple method to quote in the standard manner.

  Lot's of folks assume everyone is on a system running unix.
  I'm not. No, not MSODS either. It's Apollo Domain. And yes,
  sometime I'll have the free time to locate vi or emacs ...
]

OK, that more or less answers my questions about mail through
gateways, but what about services like telnet and FTP? Should these
type of sevices be alowed through a gateway?

Here is the big problem- what if an amateur was to ftp something like
a X-rated GIF through the gateway (I know at 1200 baud it would take
forever..) Who would be held responsible for this action the amateur
or the license of the gateway?

In this case (as in any FTP session) there is no third party- one
amateur controls the data that is passed so long as the remote site
lets him. With all the anonymnous FTP sites around there is NO WAY the
gateway operator can have absolute control.

Also: in a telnet session how would one deal with the third party trafic that
could be created if a person checked his mail on a remote system?

It all comes down to who is responsible for the data flow through the
gateway. If an amateur (other than the licensed ham gateway owner)
opens a path using that gateway is he resposible or is the gateway
station?

Many thanks to Willis Marti for his coments so far. If I can get these
legal problems straightened out there may soon be a fully functional
gateway at Rutgers University.

The person responsible for the transmitter that sends the dirty bits
is responsible, ie the guy whose call is on the gateway. In a ftp or
telnet session from the Internet, your gateway is *originating* the
traffic into the amateur spectrum so you're responsible for it's content.
You *could* have your system change it's callsign to the requestor's
callsign, with a different SSID, for the duration of the transfer and
claim that he was operating the station under remote control rules. Then
he's responsible.

Wormhole repeaters, on the other hand, are no different than split
site repeaters of more conventional type. These can always act under
automatic control, and so far the FCC has held them blameless for
content. In this case the encapsulated AX25 frames originated in
the amateur spectrum and are relayed into the amateur spectrum. The
Internet is acting solely as a common carrier no different than
a phone line connecting a split site repeater.

At least that's my interpretation.

Sidney,

Randy Bush asked for a host list for Namibia which I gave him and we
will keep all legal hosts in his MX data base and bounce all others.

regards, el

Well,

actually VAXmail uses :: instead of : which it uses to differentiate
between the drive and the subdirectory. In any case you can do
everything under DECnet if you use enough pairs of " (so twenty or so
:-)-O

I 'grew up' on VMS but with the sanctions DEC didn't sell here and now
we don't have enough money to buy their hardware (as much as I like it
:-)-O)

If you want to unload your old VAX, be my guest...

Hello everyone,

A few days ago I asked about the hypercard stack that teaches one
how to become a ham. Since then I've received mail from many people
asking me to forward the info that I received. I felt that it would
be better if I posted it for the benefit of everyone.

-Marc

Captured from rec.radio.amateur.misc by Antonio Querubin early this month
-- from dls@genrad.com (Diana Syriac, see signature line for her info.)

LATEST VERSIONS: Novice v3.3, Technician v3.5, General v2.3,
                  Advanced v2.3, Extra v2.3

This is another announcement about the MacIntosh HamStacks which I have
created. If you are not interested, press 'n' now.

I have created five HyperCard stacks to help people practice for the
written Amateur Radio tests. There is one stack for each of Novice,
Technician, General, Advanced and Extra questions. Each stack is an
interactive multiple-choice test, created from the entire question pool
for that class of license. The test is randomly generated, using the
algorithms provided for each of the tests from ARRL, so this is a real-live
simulation of the tests you will get in front of a VE. There are some
print capabilities (you can print a test with a separate answer key, but it's
slow. you can also print your results of how well you did, along with the
accompanying correct answer key) and at the end of each test, it will tell
you how well you did, allow you to review the missed questions, and allow you
to take another randomly generated test. If you can consistently score
over 90 on the tests, it's almost a sure guarantee that you will be able to
take and pass the VE proctored test.

Note that these stacks will only work on a MacIntosh computer. HyperCard
version 1.2 or later is required; they were generated with HyperCard version
1.2. Because HyperCard data is NOT stored in any ASCII form, there is no
way that this data can be used on other computers, including IBM PCs, so
please don't ask for the impossible. Also, I do NOT have access to email

these stacks over the computerwaves, nor do I have ftp capability. There are a couple of sites which are supporting these stacks via ftp, as follows:

These stacks are supported by ftp by Charley Kline, c-kline@uiuc.edu. To access the files, type "ftp uxc.cso.uiuc.edu", log in as "anonymous", with your email address as the password. Type "binary" at the prompt, then type "cd pub/ham-radio". The five hamstacks are (eg): novice-v3.2.hqx.Z, technician-v3.3.hqx.Z, general-v2.2.hqx.Z, advanced-v2.2.hqx.Z, and extra-v2.2.hqx.Z (or similar names). To retrieve one of the files, (for example, the Novice one), type "get novice-v3.2.hqx.Z". When you're finished retrieving all the files you want, type "quit" to exit ftp. Each file must be uncompressed before moving it to the Mac: "uncompress novice-v3.2.hqx.Z". You need to use Kermit to transfer the files to the Macintosh. The files must then be un-binhexed by UnStuffit, then unstuffed by UnStuffit.

The latest versions of the stacks are shown below, and are compressed with Stuffit Classic. UnStuffit is included on the diskette. These versions include modifications for NoCode (very minor changes from v3.0 or v2.0).

- Novice version 3.3
- Technician version 3.5
- General version 2.3
- Advanced version 2.3
- Extra version 2.3

If you wish to receive these PUBLIC DOMAIN stacks from me, please send me a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette. I will no longer send out the stacks unless the envelope has sufficient postage for return mail (in general, that means .52-.98, depending on size of envelope) and for those who send a standard business envelope, I take no responsibility for the condition of the diskette through USnail.

Thank you for your attention.

Careful here. How does the callsign show geographic area? It was originally
issued in the Northeast, but is Rich still there? For example,
as hard as you try, you will have a difficult time finding me in the
Southeast US, no matter how bad I may wish to move back (for a while, at
least)...

|> >or the license of the gateway?

Without discussing which specific file formats would be obscene (I mean,
what about IBM VSAM files. **ugh**), let's just say there are data that,
if transmitted over AMPR, would violate either the no obscenity/profanity
or the no business rules. There is a separate concern over data from
a non-amateur (not addressed yet).

In a perfect world, the questionable data would not be sent & I don't
think there would be a question as to the appropriateness of the link.
The real question is "who's responsible?".
|> >
|> >In this case (as in any FTP session) there is no third party- one
|> >amateur controls the data that is passed so long as the remote site

Not necessarily true. You may implement an access control mechanism that
would be transparent for 'authorized' sites yet prevent access to/from some

other list of sites/protocols.

[more stuff deleted]
|> The person responsible for the transmitter that sends the dirty bits
|> is responsible, ie the guy whose call is on the gateway. In a ftp or

How about we try an analogy with more mature technology... the autopatch.
Two situations:
(1)You own an open repeater with phone patch. From my HT, I establish a
call to my house, where my answering machine picks up the line and, to
my chagrin, transmits a profanity over the air. Who's responsible?
(2)Same as above, except that you operate a closed repeater to which I've
been given access after acknowledging that it was possible for my actions
to cause violations of FCC rules. Or maybe it's a club repeater & you're
the trustee and we're both members.

{I have *opinions*, but no real *answers* for both situations. I'd
appreciate comments.}

[even more deleted]
|> Wormhole repeaters, on the other hand, are no different than split

I agree.

=Nope. The originator of a third party message is not allowed to
=be operating under automatic control. 97.109(e), 97.115(b)

Al is probably correct IF the data is third-party.
If the data is the requestor's (by whatever appropriate definition),
then the referenced part 97 rules don't apply (Al actually posted the
content of those rules earlier. Thanks!).

So what rules do apply? Automatic control?
What if the SSID isn't changed? {remember, still no third party stuff}

Cheers,

I just passed the codeless Tech exam and am in the process of upgrading to
General or more advanced privileges. My interests are in amateur satellite and
packet radio operation, in particular using the new PACSAT/LOSATs launched last
year. Being new to amateur radio in general and amateur satellite in
particular, I would appreciate any comments people may have. A specific query
I have concerns the equipment needed for such operation. For example, is a 2m
FM transceiver with a simple 1/2 half wave vertical antenna and a 70 cm to 2m
receiving converter sufficient for the J-mode of operation on the PACSATs.
Also, what type of packet modem is needed for this type of operation. All
suggestions are greatly appreciated.

Au contraire, I am not accusing you of anything.
My comment was about the amount of bandwidth that we have inflicted on you
discussing the problem.
Surely there are not as many fools mis-addressing mail to you as well
intentioned people arguing about addressing.

>Nope. The originator of a third party message is not allowed to
>be operating under automatic control. 97.109(e), 97.115(b)

Al, et al.

Yes--but. From my understanding if using the requestor's callsign, this
presupposes that the originator is a ham. If so, then it is not third-party
traffic--it is automatic control.

If the originator is just an internet user, then this is clearly third-party
traffic. It seems clear that the analogy here is like a cross-band repeater,
it is not the repeater trustee who is responsible for the traffic.

Or is it? Anyone remember that 900 number ALLUS bulletin?

What does a dirty bit look like???

And how do you tell it is dirty? :-)

Now I have seen the old codgers with tty's and their "dirty"
paper tapes of naked women made out of letters. You can usually
tell dirty baudot by the sound. (IE: if you hear it, it is usually
Miss November.) :)

rec.radio.swap:524
Originator: benjamin@uikku.ee.tut.fi

There are dozens of kits available for 2 m and 70 cm from various
manufacturers. However, I have never seen anything like a 23 cm
FM receiver and transmitter kit in advertisements. I know that
e.g. Down East Microwave makes nice transverter kits but are there
any simple kits available for just FM use.

The idea is to find an easy way to interlink our node, mailbox and
cluster on 23 cm to get rid of all the forward traffic on user port
frequencies.

Any info appreciated.

Hello friends !

We are now planning update of YU3 packet network, and
PackeTen is obviously best solution for mountaintop nodes.
Our nodes are really on mountains, and there is no way
to put PCs with disks to loactions. But, something had to be done
in near future [I hope @$#@#$@ stop fighting in YU].

I send E-mail to Gracillis [Bdale confirmed they really received it],
phoned to them and left message into voice machine, but up to now
we have no information from them.

These days we found source for few pieces of 68302, so maybe it is
best to start own project. While our ideas are little different
as PackeTen, I would like to keep HW as compatible as possible, so
software can be ported with minimal efforts from one to another
68302 based machine.

Can somebody mail memory mapping of PackeTen ? I guess this is
main compatibility question. So far, I have no plans for multi CPU
interface, to keep machine as simple as possible.

How about software ? Is PackeTen software available in source ?
It is based on KA9Q code, so probably they should follow same
copyright policy ?

Thanks !

I was talking to a local ham who is knowledgable on the subject of
packet radio. His conclusion was that a gateway would come under the
rules of automatic control.

part 97.109 e:
No station may be automatically controlled while transmitting
third-party communications, except a station retransmitting digital
packet communications on the 6m and shorter bands. Such stations must
use [ax25] (or compatible). The retransmitted messages must originate
at a station that is being locally or remotely controlled.

As I see it this means that any conection from radio to internet would
be legal under either automatic (for mail) or remote (for FTP,Telnet)
control.

This also means that the gateway can not function in the other
direction without a control operator present. This could include a
control operator who is half way around the world and is controling
the gateway over internet- in this case internet would function much
like a phone line used for remote control. This still means no
messages from non-amateurs, but it would alow amateurs to send mail
and start ftp sessions from the internet side.
     A simple access control list with passwords and call-signs would

seem to be sufficent to insure that is was an amateur controling the
gateway.

Have I left anything out? The ability for any amateur to use the
gateway from the radio side, the automatic forwarding of mail TO
interne, and the ability of a licensed amateur to use the gateway from
the internet side are what I wanted to do. Third party traffic from
internet sources would still have to be monitored just like is is
under any other situation.

This may push the rules a little, but these rules were written before
people even thought the posability of conecting internet and packet
radio. Does anyone feel that this interpritation is to liberal? Is is
all correct?

part 97 sections:

97.109 automatic control (sec "e" deals with digital stations)
97.213 remote control
97.115 third-party traffic

Thanks for the help so far- it looks like it would be worth it to set
this thing up and get it running.

>At the risk of violating the "don't ask the FCC" rule, I'm going to
>continue this in a public forum...

Dave Sumner's editorial was directed at FORMAL inquiries to the FCC.
They are required to make an "on the record" response o such queries and
can be in hot water if they allow something that later proves abusive.
As a result such inquiries ALWAYS (not just the FCC) will be biased
negatively just from a "CYA" viewpoint.

Dave's comments don't apply to discussions among ourselves, nor to
"informal" inquiries which won't be held against the person responding
afterwards.

Of course ther is always the question of "just what IS obscene". I don't
think there exists an answer beyond "what is upsetting to those in power
at present".

>How about we try an analogy with more mature technology... the autopatch.

>Two situations:
>(1)You own an open repeater with phone patch. From my HT, I establish a
>call to my house, where my answering machine picks up the line and, to
>my chagrin, transmits a profanity over the air. Who's responsible?
>(2)Same as above, except that you operate a closed repeater to which I've
>been given access after acknowledging that it was possible for my actions
>to cause violations of FCC rules. Or maybe it's a club repeater & you're
>the trustee and we're both members.

In both cases though there is a "live" control operator who "originates"
and "controls" the transmissions. While you won't find any regulatory
authority who admits this, there is a "reasonable and prudent" rule
which applies. If you hear the bad words and shut it down as best you
are able, then you have done all that is "reasonable and prudent". If,
however, you sit back and "enjoy the show" for 10 or 15 minutes then you
should get gigged!

The real debate concerns "control" of automatic stations such as packet
relays. To me the most reasonable position to take is that the
originator "controls" the entire chain of transmissions, sending naughty
words to ALL@ALLUS should get the originator (alone) several HUNDRED
violations. IMHO

How does one send a UDP broadcast over ka9q?

I'm using Ip_addr as the lsock.address and my own port as
both lsock.port and fsock.port, with a broadcast address
of 128.96.0.0 as fsock.address but ip_route() gets called
with a packet from some weird address to a weird address:

source addr: 0.20.45.98
dest addr: 198.129.80.196

any ideas or is there an easy way to send udp broadcasts with ka9q??

thanks in advance,
cheers,
Tony

Al, my copy of the rules says part 97.115 prohibits the transmission of
music. Could you post the quoted sections. I know I need to get a new
copy of the rules.

Automatic transmission of third party traffic is legal in repeater and
auxiliary service. The described operation could be considered auxiliary
service.

Well I was just prowling my copy of the rules trying to figure out
how the transmission of music got into this discussion and found
this:

97.119 Obscenity, indecency, profanity.

     No licensed radio operator or other person shall transmit communications
     containing obscene, indecent, or profane words, language, or meaning.

Now transmitting a gif file isn't transmitting obscene, indecent, or
profane *words*, or *language*, but perhaps *meaning*. This falls into
the same grey area as transmitting MIDI sequences being construed as
transmitting music. Since I believe that the *intent* of both these rules,
music prohibition and obscenity prohibition, are aimed at material sent
in the clear and receivable by the general public, computer files and
MIDI files don't seem to fall under the intent of the rules.

Following the discussions on what to do about the .NA problem I have obtained from Tom W3IWI a copy of his paper on 4 letter continent/location designators. Since this has been so highly discussed, I thought it would be appropriate to pass this on to the rest of the net.

Tom has given permission for me to post this...

The article comes from the 9th ARRL Network Conference Proceedings.

Some comments on the "H"ierarchical Continent Address Designator

Tom Clark, W3IWI
6388 Guilford Road
Clarksville, MD 21029

At the risk of opening Pandorra's Box, this note suggests a change in the 2-character continent designator portion of the PBBS "H" hierarchical address field. An example would be the North America .NA portion of the packet address,

K9DOG @ W6SIX.DE.USA.NA

Let me state at the outset that I'm not convinced that we need to use the continent field. It seems to me that the country field by itself is adequate and that the packet BBSes can easily keep track of all the countries in the world. Let me also state that many of the issues addressed here arise because of constant confusion between the functions of addressing and routing.

The correct continent to assign to many countries of the world is confusing and/or ambiguous. To cite some examples of problems which have already been identified:

- 5B4=Cyprus in the Mediterranian is listed by the IARU (for WAC) and the ITU as Asia. Ditto 4X=Israel and JY=Jordan in the middle East.

- Both TA=Turkey and and the Soviet Union have part of their counties in Europe and part in Asia. 8Q6=Maldives is listed as both Africa and Asia. Several other countries are also "split".

- Although DU=Philipines and YB=Indonesia are regarded as Asiatic countries, the are listed as Oceania, along with Australia and Hawaii. If you venture to 9M=Malasia, you may be in either Oceania or Asia.

- The Central American and Carribean countries are nearly all part of North America, including YV0, but not 9Y. Anyone care to guess what continent the southern part of HP=Panama is in?

If the purpose of the continent portion of the "H"ierarchical address is to facilitate delivery of messages, then it is illogical to route Israeli and Jordanian traffic through the Orient. It is illogical to make automated routing decisions for messages to Turkish amateurs based on whether the addressee is on the east or west side of the Straits of Bosporus.

Stations in Israel and Cyprus already face this dilemma. Rather than using a .AS Asian address, they choose to use .EU European designator to avoid having their packet mail routed via the Orient. Some have suggested the use of a new continent designator other than .AS; One suggestion has been .ME (Middle East) but this has a serious conflict with the state of Maine.

The Central Americans and the Carribean are both "legally" .NA but feel they need a separate geographic identity and both areas have independently suggested the use of .CA but this would conflict with .CA state.
All this leads to my suggestion that the present 2-letter continent designator must be changed. Either:

(1) The present 2-character designator should be dropped because it it not really needed and there are too many ambiguities. Users will always try to use address quirks to force routing, so don't give them the chance to fould things up. The computers at the international mail gateways can easily handle the entire DXCC list.

- or -

(2) A new logical regional designator which allows sub-continent sized regions should be adopted.

If a new, more flexible scheme is to be adopted, I'd suggest that new 4-

character designators be chosen:

- .NOAM, .SOAM, .CEAM, .CARB replacing the present .NA & .SA and solving the Central American and Carribean problem,

- .ASIA replacing .AS for the Orient,

- .MDLE for the middle-eastern countries like 4X, JY etc.,

- Oceania divided into smaller areas like .NPAC, .SPAC, .AUST,

- The Indian ocean (now partly in .OC and partly in .AF) be designated .INDI,

- .AFRI replacing .AF for Africa and .EURO replacing .EU for Europe,

- .ANTR added for Antarctica,

- Additional new designators added as needed for sub-continent sized logical areas.

NOAM replaces NA for the USA and Canada
CEAM is added for CEntral AMerica including Mexico and Panama
CARB is added for the CARriBean island countries, including 9Y
SOAM replaces SA
AFRI replaces AF
EURO replaces EU
MDLE is added for the MiDdLe East including 5B4, 4X, HZ, JY etc.
ASIA replaces AS including YB and 9M
AUST replaces AU
NPAC replaces OC for the PACific Islands North of the Equator (including KH6)
SPAC replaces OC for the South PACific
INDI is added for the INDIan Ocean islands (VQ9, 3B8 etc)
ANTR is added for ANTaRctica

This scheme affords the logic of a 2-character field (.MD) for the "state", 3 characters (.DEU) for the country, & 4 (.AFRI) for the continent/subcontinent and avoids conflicts between state-sized areas and continents. Who knows, a few decades hence a 5 character field (.EARTH, .VENUS) may be needed too!

>traffic--it is automatic control.

The only way this would work is if every potential (amateur) message
originator were considered a control operator. This is a bit hard to
swallow since these "control operators" would typically not even know
where the station was located or what frequency it is operating on.

Sorry, it looks like I came into this a little late and only
caught the politics, not the logistics.

I'm only on the internet side and want to send e-mail back and forth
to a friend only on the packet side. Is there a general way to do this?

Forgive a pragmatic response to a technical problem,
But I have observed the above signature quite a number of times.
This has raised a question for me. Considering the bandwidth of this
discussion, and presuming that Dr. Lisse is getting our side of this
discussion also, and allowing his own above remark that the problem is not
gateways but users forgetting which network they are on and mis-addressing;
Then surely there is more discussion than mis-addressed mail.
If that is the case, could it be we have a straw dog? I am not saying that
the addressing problems do not need to be rectified, but this discussion and
its "wheel-spinning" are more of a problem than the problem.

Thank you for your patience,
                        Chris N4VTE

all this discussion on mail, and thinking about it last night, has brought
up some other questions I should have asked yesterday..... :-) some of
this isn't directly related to the flaming/discussing going on, but they're
all mail questions, and most are at least indirectly related.

In article <9108100031.AA21658@ucsd.edu> enge@almaden.ibm.com
(Roy Engehausen) writes:

>Finally, we amateurs must answer the question:

>
>   Do we want the TCP/IP network and the packet AX25 BBS network
>   to be able to interoperate?

of course we do. there is absolutely no reason why they should not be
able to interoperate. I have a (sort-of) BBS running here --- it's my hacked
version of G1EMM's hack of KA9Q's TCP/IP code (I've added some power it
lacked, and took out memory-wasting stuff I didn't need). I would like very
much to tell the AX25 BBSs that my home BBS is n5ial.ampr.org --- then I
could check that mail locally, just like I do other mail. I'd also be
able to just send mail to someone from a file (like mailing someone src
code in a sh archive, uuencoded ZIP files, etc.)

considering the fact that the AX25 BBS I currently check into (WB9YAE)
is running TCP/IP, I don't see why this should be a problem. (Note, he
isn't running nos --- he's running MSYS, which is one I'm not familiar
with.) I can telnet to him or connect to him...same results.

now, another question. someone who isn't running TCP/IP wants to send me
e-mail via ax.25, but to my TCP/IP address --- how should they do the
addressing on their end?

now, the opposite in reverse --- from TCP/IP, I want to send mail back to
their ax.25 address. how do I address that?

oh, btw, "why would you want to do that?" isn't much of an answer....please
don't bother with that one...I *** DO *** want to do that. I'm looking for
real answers on how to use whatever gateways there are between these.

third --- TCP/IP on both sides.... if I want to send mail to anywhere in
the US (or out of it, for that matter), are there smart mailers setup
somewhere that know about every address in .ampr.org? can I just send it,
confident in knowing that some mailer will know how to get it there, just
like on the Internet?

>Can we confine the discussion on this to technical issues
>rather than political/religious flaming?

well..... :-)

   --jim

>I'd appreciate any pointers as to:

>* What sort of license do I need (new code-free sounds nice)?

You can do packet with the code free license.

>* How much does the equipment cost?

couple hundred for a tnc, and about a hundred for a used rig

>* How far can I go (I am moving about 17 miles and over a hill from the campus)?

Packet can go forever. simplex can do 40-60 miles with a good antenna (or
more) and over digipeaters, you can go hundreds if not thousands of miles.

>* Is there an existing TCP/IP implementation for packet radio that will run on
> my Sun?

Ah. BUT. packet is slow. and the application you are talking about is
probably not technically legal. If you have ANY graphics on your terminal
forget it. I have seen it take 10 to 30 seconds between linefeeds on a
packet system when it is busy.

This is why I have never gotten all worked up over packet. I like the
immediacy of my net connection. Of course, being the sysadmin, and having
the hardware in my home sort of does spoil a person.

Reasons it may not be legal to connect to your work site:

1. Prohibitions against anything REMOTELY commercial. You can not legally call up the boss over the repeater autopatch and tell him you are gonna be late for work. You can not order a pizza (I think that was the concensus here, wasn't it?) and you could certainly NOT do any work related duties over packet

2. There are very strict prohibitions against third party messages and they must be approved by a licensed operator before being transmitted. So don't count on reading the net over packet. also the net frequently finds itself peppered with nasty words. this is a NO NO on ham radio.

ZZ

>   aa4re.#nocal.ca.usa.na.ax25bbs
>
>This change will be transparent to most AX25 BBS programs.

This idea makes sense. If you look at the way that several other networks (uucp, bitnet) gateway with Internet, this is exactly what they do. For example, if I want to send mail from my node (on Internet) to uunet which lives on the uucp network, I would address my mail to: userid@uunet.uucp   Similarly, if I want to send mail to someone at the University of Ottawa, which lives on bitnet, I would address it to: userid@uottawa.bitnet
The ".ax25bbs" (".bitnet", ".uucp") implies the existance of an Internet domain of that name, which is used to route the message to the appropriate gateway.

Now, I'll admit that there are other addresses which I could use to get the mail to the sames places (eg: ulaval.bitnet is the same as vm1.ulaval.ca -- routing will take care of things, since Laval has a node on each network), but you get the point.

I think one of the main things here is that we are gatewaying into an existing network. As such, the gateways MUST play by the rules of both networks, and must be given the "smarts" to differentiate between the two networks. If messages are going from a network (Say, A) out to a point on another network (Say, B), then back to A for final delivery, then something is wrong. This is true whether amateur radio is involved or not.

Here's another solution. Let's say that I'm on a network (OK, let's say it's BBSNet), and I want to send something to a node on Internet. So, I add ".internet" (or something) to the end of the address. This explicitly tells the gateway, to forward the message (stripping the ".internet") via Internet to the appropriate node.
If I don't put the ".internet" on the address, then the gateway will NEVER forward it to Internet. The message will be assumed to be destined for a node on the local network and if it cannot be delivered, then there is an error in the address. Again, this is how most networks work.

Please note that I've tried to steer clear of the arguing that is going on regarding this topic (Since it really doesn't seem to be leading to anything). The above comments are true for almost all networks which want to interact.

I AM POSTING THIS ON BEHALF OF A FRIEND WITH NO CURRENT NETWORK ACCESS

What is happening - if anything - in the standardisation of protocols
for Wide Area Radio-based packet networks for data transmission
(i.e. Aloha and its descendants)?

I need references to papers, reports of progress, and contacts with which
to discuss any US or Japanese activity and to exchange information on what is
happening in Europe. Any related activity -

  - Circuit-swicthed radio data nets if data provision is more
    than just an add-on to digitised voice

  - Packet-switched radio LANs, but only if the technology is thought
    to be adaptable to wide area use

- is also of interest.

Any archives which contain information about current standardisation
might also be useful.

All contributions gratefully received! Will summarise to net if sufficient
interest.

Thanks.

This paper discusses the reasons for setting up an amateur packet radio
to Internet gateway, technical and hardware features of such a gateway,
and security aspects of maintaining a gateway.

Several sections of this paper require some knowledge of amateur packet radio
operation, Internet site operation, connecting hardware, and Internet
security. These sections will be marked, and I will try to summarise each
section in a manner that does not require this knowledge.

This paper is intended for people who have to install a packet-Internet
gateway, people who must maintain a packet-Internet gateway (both at the
software and hardware level), people who manage a set of Internet machines,
and people who provide the facilities for a set of Internet machines (such as
a University). This is a wide range of readers, so I apologise in advance if
you find some of the material too far below or above your level of
understanding.
}

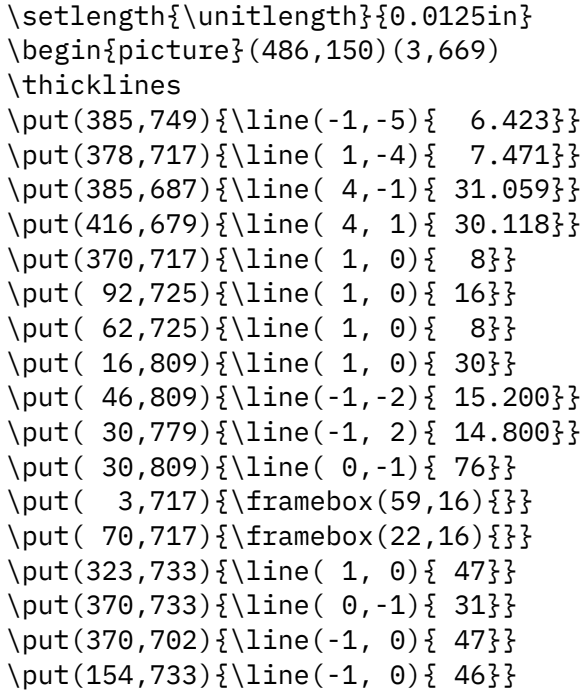
\vspace{1cm}
\section{Introduction}

The Internet is a large network of academic and commercial computers in
the United States that provide a number of communication services (such
as electronic mail and file transfers) to its users, via the TCP/IP
network protocols. This network is connected to other networks, such as
the AARNet in Australia, and networks in Europe and Japan, to provide a
global computer network.

The amateur radio service consists of a large number of individuals
(known as amateurs or Hams)
throughout the world who use radio communications to pass messages,
chat, and exchange information with other amateurs on several radio
frequencies that are allocated for their use. To become an amateur,
an individual must undergo an examination which tests the individual's
knowledge of the technical operation of radio equipment, radio propagation,
electronic theory, as well as legal and other aspects of amateur radio.
Thus amateurs form a highly technical, capable and responsible group
of people, who are able to provide communication during emergencies,
natural disasters, as well as for their own use.

The amateur radio service is also actively involved in finding new and more
efficient forms of radio communication - techniques such as single sideband
radio and reduced spectrum radio were invented by amateurs.
In the last decade or so, amateur radio operators have been involved in
researching new forms of digital radio communications. This research has
led several amateurs to experiment with different communication protocols
for digital radio communications, including the TCP/IP protocols used on
the Internet.

The Internet protocols have been found to be very useful for radio
networking, and are now used widely by amateurs. To this end, a block of
16,387,064 Internet addresses has been allocated to the worldwide
amateur radio service.



Fast and effective digital radio communications is limited over large distances, due to the distortion and noise introduced by the atmosphere, and the curvature of the Earth. Amateurs have sought several methods to overcome these limitations, such as amateur satellites, which are designed and built by amateurs, and provide store and forward message capabilities as well as digital repeater services.

Another method of overcoming the distance limitation is to use the Internet itself to route digital messages between distant amateur stations. This is easy to accomplish as amateurs are able to use the same network protocols, TCP/IP, as used on the Internet. This method of long-distance amateur communication has been implemented at several places in the world: Australia, America, Switzerland, the Netherlands and Canada, and has been found to be very simple to set up and operate, and is very reliable.

There are two legal/policy aspects of these amateur radio--Internet gateways. The first is the amateur radio service enforces that amateur communications must be between two (or more) licensed amateurs: therefore, non-amateur Internet users must not be able to use the gateways to transmit messages. The second is that many AARNet/Internet sites' policy is to prevent non-registered users from accessing local/Internet resources: therefore amateurs may only pass messages to other amateur gateways. The software that controls the packet--Internet gateways has been written to solidly enforce these two conditions.

\section{The Gateway}

A packet--Internet gateway obviously must be able to communicate to both the Internet, and the amateurs in its local area. Therefore, it must have at least two {\bf interfaces}, one to the Internet, and one to the amateur community. This is shown in Figure 1.

\end{picture}
\begin{center}
{\bf Figure 1:} Packet--Internet Gateway Block Design
\end{center}
```

The gateway is a machine that runs the software that enables it to perform its function. Currently, this means that it must be an IBM PC computer or clone, running the latest version of the NOS software by Phil Karn or Gerard van der Grinten. The software itself is freely available, but is copyright by the software authors. For performance reasons, I would recommend a computer with at least the performance of a 10MHz IBM XT, with 640K or memory, and at least a small hard disk.

Each interface must have a unique IP address, so that both the local amateurs and the other gateways can communicate with it. The Internet interface's address is assigned by the AARNet/Internet administrator of the institution, and the amateur radio interface's address is assigned by the local amateur IP administrator.

Each interface must also have the appropriate hardware needed for it to communicate with its destination. On the amateur radio side, a {\bf Terminal Node Controller}, a {\bf transceiver} and an {\bf antenna} convert the packets from the gateway into radio transmissions that can be received by amateur stations. On the Internet side, there are two main options: an {\bf Ethernet card} connects the gateway to the local area network, which is part of the AARNet/Internet, or a {\bf serial line} connects the gateway to another machine in the institution which is on the local area network, and hence is part of the AARNet/Internet. The serial line can run either the SLIP or PPP protocol to communicate with

the other machine.

\bigskip

That completes the overview of the hardware setup of the gateway. This
leads on to several considerations:

\begin{itemize}
\item The gateway and other hardware must be reliable, and be readily
        available to the maintainer of the gateway to fix unforseen problems.
\item The gateway must be placed in a physical position to suit both
        its connection to the AARNet/Internet, and to the TNC/transceiver.
\item The transceiver and antenna must be in a position to satisfy both
        the needs of the local amateur community, and the wishes of
        the institution where they are to be situated.
\item If using Ethernet, the gateway's position must allow it to be
         physically connected to the local area network.
\end{itemize}

\noindent At this point, it should be mentioned that at least one of
the people maintaining the gateway must have a current amateur radio
license. The institution providing the Internet connection may also wish
to appoint another person to ensure the gateway meets the policies of the
institution; this of course may be the same person.

\section{How the Gateway Works}

At an elementary level, the gateway works as follows: Messages are broken
up into {\bf packets} when they are sent over the Internet. When the gateway
receives a packet on one interface, it checks the destination IP address in
the packet, and according to its table of {\bf routes}, it retransmits that
packet on the interface that will send the packet to its destination. For
example, a packet from the local amateur radio community to a gateway
in another country will be received by the local gateway, retransmitted by
the gateway on its Internet interface, and will travel along the Internet
to the destination gateway, where it will be received and retransmitted by
the transceiver at that gateway.

In practice, this is not as simple, because of the following reason. Even
though the global amateur community has been allocated a block of valid
Internet addresses, none of the Internet machines in the world know how
to send packets to these addresses. This is because up until recently, no
amateur computers were connected to the Internet.

The easiest solution would be to advertise the routes to these addresses to
all Internet machines, but this was not done for the following reasons:

\begin{itemize}
\item Amateur stations are not as geographically fixed as most Internet
        computers, as their computers are generally smaller, and the
        radio medium allows amateurs to move around and still communicate
        with each other, and
\item Advertising amateur computer addresses to all Internet machines greatly

```
        increases the possibility of non-amateurs accessing amateur
        transmitters.
\end{itemize}

The solution adopted was to {\bf encapsulate} amateur packets received by
the gateways inside another packet, transmit this bigger packet to the
destination gateway, which unwraps the packet and transmits the
contents [Woodburn et al. 1991]. This is illustrated in Figure 2.

\end{picture}
\begin{center}
{\bf Figure 2:} Amateur Packet Encapsulation
\end{center}

The first packet shown is the packet transmitted by an amateur and received by
the local gateway. At this level, the source and destination address are
both amateur addresses. The local gateway determines which remote
gateway this packet must be passed to, and {\bf encapsulates} the packet
inside a new packet, with source and destination addresses being the Internet
addresses of the local and remote gateway. The packet is then placed on the
Internet, where it is passed to the remote gateway.

This encapsulated packet (the second packet in Figure 2) is seen by the
Internet to have a valid source and destination address, and can be passed
```

to the remote gateway. The Internet sees the wrapped packet as data, which it ignores.

At the remote gateway, the packet is received and unwrapped; this is the third packet in Figure 2. The remote gateway determines which interface to transmit the unwrapped packet, according to the destination address. Reply messages are encapsulated in exactly the same manner.

\section{Security Aspects of Encapsulation}

The encapsulation method satisfies the security considerations discussed in the Introduction:

\begin{itemize}
\item Because no Internet machines know how to route packets to amateur gateways, there is no possibility that non-amateur packets will be transmitted on amateur transmitters.
\item All incoming amateur packets are encapsulated by the local gateway, preventing amateurs from accessing any Internet machines, except for remote gateways. Therefore, amateurs see the connection between the gateways as a very long piece of wire.
\end{itemize}

There are, however, other ways of overcoming these barriers, by using some of the applications built into the gateway software; these can be easily prevented, and are discussed in a later section.

\section{AX.25 Encapsulation}

One of the first digital protocols used by amateurs, and still the most widely used, is AX.25, a reliable protocol based on X.25. One of its limitations is that AX.25 packets cannot pass through more that 7 intermediate machines before reaching their destination. This limits the distance AX.25 packets can travel.

The latest versions of NOS include AX.25 encapsulation, which operates in exactly the same way as normal IP encapsulation, thereby allowing long distance AX.25 communication while still obeying the 7 step limit [Kantor 1991].

\section{Preparing the Gateway Machine}

This section discusses the aspects of preparing the gateway for the software that will make the gateway work. It is assumed that:

\begin{itemize}
\item You have a fairly good idea of the Internet and how it works.
\item You have a reasonable understanding of the NOS software. If you don't, you can either obtain a `plug 'n play' disk from me by mailing me a note to my email address at the beginning of the paper, or you can anonymous ftp to the machine {\tt ucsd.edu}, cd to {\tt hamradio/ka9q/nos}, and get the software from there.
\item You have a copy of the NOS software dated at least June 1991. Either the {\sf ka9q} version or the {\sf pa0gri} will do. {\tt ucsd.edu}

has the latest versions in the ftp directory given above.
\item You have a gateway that meets the hardware specifications given in
the Introduction, and the hardware needed to form the interfaces --
that is, a TNC, a transceiver, an antenna, and an Ethernet board
or a serial link to a machine on the Internet that can talk SLIP or
PPP. The gateway will also need around 1 Megabyte of free disk space.
\item You have a local amateur IP address for the machine, and a local
Internet IP address for the machine.
\end{itemize}

Your first step is to give the gateway two domain names, a name for the
other gateways to know, and a name for the amateurs to know. Your Internet
name should follow any rules specified for your institution. Your amateur
domain name should be of the following form: {\tt name.callsign.ampr.org}
where the callsign is the callsign of the amateur that will be operating
the gateway, and the name is whatever name you want to call the machine.
An example of Internet and amateur domain names is {\tt minnie.cs.adfa.oz.au}
and {\tt minnie.vk1xwt.ampr.org}.

You need to register the Internet name on the Domain Name Server for your
local area network.
You then need to register your amateur domain name with the Domain Name
Server for the amateur service. This is the DNS server at {\tt ucsd.edu}.
To do this, send email to the following address: {\tt ampraddr@ucsd.edu}.
The subject line should be empty, and the email should have the following
line:

\begin{verbatim}
name.callsign.ampr.org.   IN   A   amateur.radio.ip.address
\end{verbatim}

For example, the line I sent in for my gateway was:

\begin{verbatim}
minnie.vk1xwt.ampr.org.   IN   A   44.136.0.31
\end{verbatim}

{\sf Aside: For those who understand DNS records, {\tt ucsd.edu} will also
accept CNAME and MX records. Also, you can delete previous entries by sending
the same line, with the last field on the line the word `delete'. Additions
and changes to the DNS at {\tt ucsd.edu} usually take a few days to be
entered, so make sure you get things right first.}

\section{Installing the NOS Software}

Installing the NOS software can be done in three stages:

\begin{itemize}
\item Install the software, and set the gateway
up as a local amateur radio station;
this includes setting up the TNC, transceiver and antenna. This
should not be too hard to do, as the local amateur community can
provide information on how to do this.

\item Alter the setup to include an interface to the AARNet/Internet, using
        either an Ethernet board, or a serial link running SLIP or PPP.
        You will need an appropriate Ethernet driver if you are using an
        Ethernet board -- these can be obtained from {\tt ucsd.edu} in
        the directory {\tt hamradio/drivers}. Read the documentation that
        comes with the driver package.
\item Finally, set up encapsulated routes to the other amateur gateways,
        and email their operators so that they will set up routes back to
        your gateway. Use the `ping', `telnet' and `ftp' commands in NOS
        to ensure that the encapsulation is working.
\end{itemize}

An example setup file is given in Appendix B, and is currently in use
at the {\tt minnie.cs.adfa.oz.au} gateway. This section will discuss
aspects of a gateway's setup that I think need attention.

To begin with, the hostname of the gateway should be the gateway's amateur
domain name, as it will be used mainly by amateurs. Ensure that the gateway
has a valid amateur callsign. Every interface used
by the gateway should use the amateur IP address, except for the single
interface to the Internet, which should use the Internet IP address. The
default route should be the Internet interface, as badly addressed packets
will not affect anybody there. Ensure that routes are as specific as possible:
for example, if your local amateur address are of the form $44.136.0.x$,
then you should add a route to {\tt 44.136.0/24}.

Add ARP entries for both the Ethernet address of the gateway's Ethernet
board, and an Ethernet broadcast address for the local area network.

\subsection{Adding Encapsulated IP Routes}

Adding the encapsulated IP routes to other gateways is very easy, as is
shown in the example setup file in Appendix B. Note that you must specify
the Internet IP address of the gateway, and not the amateur IP address.

\subsection{Adding Encapsulated AX.25 Routes}

Due to the implementation aspects of AX.25 encapsulation, each encapsulated
AX.25 route appears as a new {\bf interface} under NOS, and as such, needs
to have a new {\bf SSID} (Station Sequence ID), as well as a new interface
name. For example, the pseudo-interfaces used by the {\tt minnie} gateway
have SSIDs {\sf vk1xwt-2}, {\sf vk1xwt-3}, {\sf vk1xwt-4}, {\sf vk1xwt-5}
and {\sf vk1xwt-6}. These are different than the callsign used for the
gateway, {\sf vk1xwt-1}. According to the AX.25 protocol, this allows up
to 15 pseudo-interfaces, with SSIDs of --1 to --15, as well as the local
amateur interface.

For AX.25 encapsulation to work, you need to already have an encapsulated
IP route defined to the destination gateway, and vice versa.

When using the encapsulated AX.25 service, you must remember that you need
to use the SSID of the interface you want to connect through. For example,
to connect to {\tt minnie} locally, you would do:

```
\begin{verbatim}
net> connect vk1xwt-1
\end{verbatim}

However, to connect to a machine in Hawaii through {\tt minnie}, you need to
use {\tt minnie}'s SSID of --4:

\begin{verbatim}
net> connect ah6bw-1 vk1xwt-4
\end{verbatim}

Similarly, a user in Hawaii connects {\bf to} {\tt vk1xwt-4}, but connects
{\bf through} {\tt vk1xwt-1}.

\section{Other Security Considerations}

If you use your gateway with no applications running, you can guarantee
the security of your gateway. However, with three applications, the
mailbox, SMTP and RIP, your security can be breached. Fortunately, two of
these three can be set up to prevent security breaches.

\subsection{RIP}

RIP is the routing protocol that is used to pass routing information around
between machines on the Internet. Strictly speaking, a packet--Internet
gateway does not need to run RIP, as all of its routes are statically
defined. The only reason for a gateway to run RIP is to inform and/or
learn from other gateways when new gateways become available.

If you think that using RIP is a good idea, you must ensure that:

\begin{itemize}
\item You do not broadcast your routing table to your local network; if you
        do, non-amateur machines will learn about routes to the amateur
        gateways, and may allow non-amateurs to use amateur transceivers.
\item You refuse all RIP broadcasts from your local network; if you do not,
        amateurs will learn about the Internet addresses on your local network,
        which are non-amateur addresses.
\item You only send your routing table to destination amateur gateways, as
        they are the only machines who are interested in your routes.
\end{itemize}

\subsection{The Mailbox}

The mailbox application can be accessed in two ways: by a local amateur
connecting to your machine using the AX.25 protocol, or by an amateur or
non-amateur connecting to your machine by the Telnet protocol.

The mailbox provides features that you do not want amateur or non-amateur
users to access:

\begin{itemize}
```

```
\item A Telnet capability which can connect to both amateur and non-amateur
        machines.
\item A Gateway capability which can connect using AX.25 to amateur
        machines.
\item A Netrom capability which can connect using NETROM to amateur
        machines.
\item A Remote operation capability which allows a user to change the
        current setup of the gateway.
\end{itemize}

Fortunately, these are easily disabled by including an entry in the
{\tt ftpusers}
file for the user `anonymous', with permissions `1', no password, and a
home directory the directory {\tt /pub}. Make sure that the {\tt ftpusers}
file is not kept in the {\tt pub} directory, or any of its subdirectories.

You may wish to add other users entries, so that you can remotely Telnet
to the gateway and modify its state. These entries should have a password,
and you should never Telnet to the gateway from another amateur machine,
as the password will be broadcast over the airwaves for other people to
hear.

\subsection{SMTP}

Once the above security holes are closed, SMTP is the only way to bypass
security, as it allows non-amateurs to send electronic mail to amateurs,
and vice versa, and SMTP cannot be easily set up to prevent this. To
ensure complete security, turn SMTP off.

You may initially have SMTP enabled, and monitor the use of email to see
if there is any current security problems; however, this leaves the gateway
open for email interchange which may be illegal.

\subsection{Other Applications}

With the mailbox and Telnet set up correctly, the gateway is secure to
my knowledge. The following applications can be started without breaching
security: echo, discard, ftp, finger, telnet, ttylink, rip, ax25 and
netrom.

\section{Conclusion}

To summarise, the packet--Internet gateway provides fast and reliable
long-distance digital amateur radio communication, which up until
recently has been difficult if not impossible. The use of TCP/IP protocols
allows easy connection to the AARNet/Internet, as well as the local amateur
community. This long-distance connection not only provides reliable
communication for amateur and emergency use, but gives the amateur radio
community another avenue for research into radio communication techniques.

The gateway software provides the method to connect amateur gateways
together, while at the same time ensures the gateway can be operated
correctly from both the amateur and non-amateur point of view.
```

I have operated and maintained a packet--Internet gateway in Canberra for the last few months, and have found it to be very reliable, very easy to maintain, and very secure. Moreover, due to the communication speeds used in the amateur community, the gateway has added a negligible burden to the AARNet/Internet use of my local network.

\bigskip

I would be glad to answer any questions that are emailed to me at the Internet mail address given at the beginning of this paper, although I cannot guarantee the promptness of my replies. I would also greatly appreciate comments, criticisms and suggestions about this paper and how it can be improved.

\section{Example Gateway Setup File}

The following is the setup file `autoexec.net' used by the gateway {\tt minnie.cs.adfa.oz.au}.

\begin{verbatim}
A U T O E X E C . N E T   F O R   N O S
#

```
# Last update 11:00am 910719
#
# minnie.cs.adfa.oz.au provides an ftp site for minix. It also collects
# news for comp.os.minix from the local nntp server. Minnie has two
# interfaces: ec0 is a 3c501 Ethernet interface to the Internet via
# cs.adfa's LAN, and sl0 is a dial-in SLIP link, which is used to gateway
# packets from the local amateur radio network, 44.136.0.0/24.
#
# ec0 has the ip address minnie.cs.adfa.oz.au, and sl0 has the address
# minnie.vk1xwt.ampr.org. In order for this to work, we have to do the
# encapsulation before setting ec0's ip address.
#
#       Local Definitions
#
hostname minnie.vk1xwt.ampr.org
ax25 mycall vk1xwt-1
ip address minnie.vk1xwt.ampr.org
#
#       Attach ports
#
# We have up to 2 possible interfaces:
#       sl0 can connect minnie to henry.vk1xwt or switch.vk1kcm via SLIP
#       ec0 connects minnie to the ADFA net
# We also have a netrom pseudo-interface
attach asy 0x3f8 4 slip sl0 2048 1500 2400 v

Let me try this one more time as I didn't see any real comments the last time.

I agree that changing the separator in the name/routing designator is a bad idea.

I think the easiest and most effective solution would be to change the Continent
designators to 4 letters. To the best of my knowledge, there are currently no
4 letter top level domains in the Internet so uniqueness should be gauranteed.
Requesting ISO and INTERNET sanction for these should gaurantee that they
will remain unique in the future.

Can anyone give me a real good reason why this can't/shouldn't be done??

I believe that even though it appears to be impossible now, at some time in
the future, when political factions begin to realize that this isn't the 1920's,
the Amateur Packet System will be connected to the rest of the world. We
can't keep our heads in the sand forever.

> This idea makes sense. If you look at the way that several other networks (uucp, bitnet) gateway with Internet, this is exactly what they do. For example, if I want to send mail from my node (on Internet) to uunet which lives on the uucp network, I would address my mail to: userid@uunet.uucp Similarly, if I want to send mail to someone at the University of Ottawa, which lives on bitnet, I would address it to: userid@uottawa.bitnet
> The ".ax25bbs" (".bitnet", ".uucp") implies the existance of an Internet domain of that name, which is used to route the message to the appropriate gateway.

Actually it doesn't. There is no UUCP or BITNET domain; your site probably has it's mailer hacked up to fake it (I did the same with ours). There was a very large amount of discussion about this back when the domain system was starting up. Domains are explicitly not supposed to be topologically or geographically based, they are administratively based. In other words, there must be a responsible party for the things in the domain. There is no such entity for UUCP, and I would guess there isn't for BITNET.

There is a NET domain (seemed to be a kludge, but it lives) for network organizations themselves. E.g., UU.NET, NSF.NET, CS.NET, NEAR.NET, ...
There is the domain UU.NET for the UUNET organization. These domains are used for the network facilities, not the "member organizations" attached to the network. For example, we are on NEARNET, but that doesn't put us in the "NEAR.NET" domain; we are commercial, so we are in the COM domain.
However, the gateway box we have on-site here is in the NEAR.NET domain.
Again, domains names are not based on routing.

The hard part is how to gather up the many individuals and give them a domain. The current thought is to do it by country/state/town, since our

government is the closest thing to "administrative control" we can come up with. Unfortunately, that means that one's personal domainname would change when one moves, but the alternative would be a *huge* flat namespace under "US" or whatever.

> Now, I'll admit that there are other addresses which I could use
> to get the mail to the sames places (eg: ulaval.bitnet is the same
> as vm1.ulaval.ca -- routing will take care of things, since Laval
> has a node on each network), but you get the point.

VM1.ULAVAL.CA is a domain name. ULAVAL.BITNET isn't; it is routing advice (which happens to look like a domain) you are giving your mailer.

>*** So post some useful ideas please, since it sounds like you
>*** know what the solutions are.

I would suggest the obvious solution is scanning routing hints right
to left. Posting software should always require a full hierarchial
address. It may supply default continent and country, even state and
local, designators if none are supplied by the user. Then by scanning
right to left all ambiguities caused by local names are resolved properly
at the appropriate local level. Your forwarding software should certainly
have a forwarding solution for continental designators that it can
fall back on if a forwarding solution fails for countries. Similarly,
if a country solution is found, it can be fallen back on if a state
solution is missing. And so on down to local LAN names. There is
never any uncertainty because *every* address would start with the
same top level field as it's rightmost element and the software scans
until it can resolve no further. There should never be confusion between
a country code and a continent code, or some very localized code as
scanning descends the routing hierarchy. The only precaution needed to
prevent problems with other networks is to avoid using conflicting top
level names. In the case of the BBSNET, there are only seven to worry about.
The major fault of current BBS software, as I see it, is that it doesn't
respect it's own self imposed hierarchial nature, because it scans in the
wrong direction.

Gary KE4ZV

*** I'd sure like to clear this up ...

durham@ucbvax.berkeley.edu
Subject: 'NA' country domain appears to be non-unique
To: packet-radio@ucsd.edu

Gentlemen,

I , as a very minor bbs software author have had huge problems in the
past getting info about what is really going on in the pbbs world.

I see W0RLI, AA4RE and VE3GYQ ,to name three, on here and presenting
more verbage than I've ever seen from them.

How about, if not a rec.radio.amateur.pbbs, at least a mailing list
for pbbs stuff? I know about several others like me who have their
own pbbs software (because they wanted to do something that the
RLI/4RE/MBL stuff wasn't designed for, like run in a unix environment)
who would greatly benefit from knowing what the latest "whiz-bang" feature
is that's going to make us incompatible with the pbbs network *this*
week 8-) .

I guess we have to do more educating, like some suggest. One facet
of education is information, and there has been almost no flow of
same regarding the pbbs net. It seems that a lot of the present
confusion and flame-throwing were initially caused by lack of
education/information among internet folks who weren't aware that
packet radio addresses were different and should not be used on
internet !

To perhaps better summarize:
1. There is no flow of information pbbsnet->internet.
2. There is no flow of information internet->pbbsnet.
3. There is no flow of information concerning pbbs software design.

Can we fix this?
-Jim, W2XO

*** Let's do it on the bbs net. I don't usually have time at work to
*** play ham radio, and can only read/post now and then, when workload
*** is a bit slack.

|> Hank: are you listening?

     I'm sure he is.

|> Marc Kaufman (kaufman@Neon.stanford.edu)

*** Yup! Listening ... most of the time ... just not talking
*** very often (see above).

ok. here's my final question, which can also be taken as a suggestion.
if I want to send mail, for example, to friends back in Aggieland on a
machine that is on BITNET from Internet, I would address it to
joe_user@tamvenus.bitnet --- notice the .bitnet? (yeah, I know....VENUS
is also on the Internet...but it's habit now.)

so, why can't we simply register something like '.packet' with the NIC,

and put all this nonsense to bed? then, make sure people know that if
they want to mis-use .NA and call it North America, they must also use
the .packet to let the system know it is for a foreign network. now, I
must admit that mail is not my strongest area --- sendmail.cf still scares
the sh_t out of me, but it seems obvious that this is a solution to this,
and will help in any attempts to interconnect the lot.

my packet address might then look like n5ial@wb9yae.chi.il.packet or
something like that. the gateway machines (if there are any) could
then say ``hmmmm....he's a .packet, and is in ill. --- he must therefore
be in .usa.na.earth.western_spiral_arm.milky_way.universe'' or whatever
it wants. who cares --- from that point, it would be leaving the Internet
machines alone. but while on the Internet, it would conform to standards.
the gateway machine has the smarts.

likewise, if I sent mail (mind you, this all assumes that such a gateway
exists) from packet to an Internet address in Nambia,.....

while on packet:
>From: n5ial@wb9yae.chi.il.usa.na.earth.western_spiral_arm.milky_way.universe
>To: user@machine.na.arpa

once on the Internet:
>From: n5ial@wb9yae.chi.il.packet
>To: user@machine.na

so what's the problem?

oh, people would have to be sure that their .signature clearly points out
that their address is in .packet.

   --jim

Standard disclaimer....These thoughts are mine, not my employer's.

Share and Enjoy! (Sirius Cybernetics Corporation, complaints division)
73, de n5ial

Internet: zjdg11@hou.amoco.com (- or -) grahj@gagme.chi.il.us
Amateur Radio:
   TCP/IP: jim@n5ial.ampr.org (44.72.47.193)
   Packet: n5ial@wb9yae   (Chicago, IL, US)

*** This looks like it makes a lot of sense.
*** We already have ".ampr.org" ...
*** The gateways could take care of the details automatically ...
*** perhaps without much difficulty.

I have recently discovered that there is indeed a bug involving switch
statements in Borland C++ 2.0. Use compiler option -G- or
#pragma option -G-
on modules that have switch statements.

All together now, in chorus: in the Internet, NAMES ARE NOT ROUTES.
Names are names, that's all. Domains are administrative units, NOT geographic
units. ".edu" generally means a university, WHEREVER it may be. ".com"
generally means a commercial enterprise. There are servers that can tell
you how to route to any name.

Country codes as domains usually occur only for very small countries, where
everyone in the country (using that domain) uses a common server for
routing information. There is no reason in particular why some .com or .edu
addresses could not exist in Namibia.

>In fact, if internet were to simply add that top level (continental) domain

The only reason to add a domain of the form ".AF", would be if someone wanted
to coordinate addresses and routing for all of Africa, which I doubt.
If the bbs net does not have standards, how come everyone uses ".USA.NA" in
the continental US?

>Of course, if both networks chose the SAME standards, then there would never
>be a problem ... or would there ?

There might be less problem. Now, since bbsnet has maybe 10K nodes and
100K users worldwide, perhaps it should be the one to adopt the Internet
standards, since there are 100'sK nodes worldwide, and established gateways
to other networks of comparable size.

>It sure has been nice to see the educational information posted to

>   ... Hank
>Hank Oredson @ Mentor Graphics
>Internet   : hank_oredson@mentorg.com
>Amateur Radio: W0RLI@W0RLI.OR.USA.NA

If I accidently fire your AR address on the Internet, the mailers will say:
Gee, I don't know how to route that, lets ask the domain server for the ".NA"
domain. It would be preferable for your address to be something like:
W0RLI@W0RLI:OR:USA:NA, so an Internet mailer would say: Gee, that's not an
Internet address. Let's tell the user rather than send it somewhere strange.

Even adding ".ax25" would be an improvement, as long as you ALWAYS advertised
your address as: W0RLI@W0RLI.OR.USE.NA.AX25 so that Internet mailers would
never be able to match the last component as a valid domain name.

The name spaces should be disjoint. Names are not routes.

There has been quite a number of suggestions as to what to do about
this problem. Suggestions seen have included,

1. Adding a "Domain" or "Network" or whatever you like to call it name
   to the existing Amateur BBS addresses. (suggestions seen include
   BBSNET, FWDNET, AX25BBS, AMPR.ORG).

2. Getting the BBS Net to change its addresses to the 4 Letter continent
   designators and have these registered with the Internet (On this point
   could some kind soul post the 4 letter proposal to the network or at
   least EMail me a copy?) A question I have here is, what is involved
   with registering these 4 letter designators? Are there any costs?

3. Getting the BBS addresses to change the separator from a "." to a ":"

4. Educate the users not to use addresses incorrectly.

5. Develop accepted Gateway practices to handle the differences between the two networks.

All seem quite good ideas, of these I tend to favour 2, 4 and 5 collectively but am still undecided.

Someone noted that addresses like *.UUCP and *.BITNET are not actually domains. But they appear to be effective, why not implement something like that? Or use the 4 letter designators. In some ways the 4 letter scheme could work better as although the Internet is Domian and name based I cant see why a location couldnt be specified and have internet mailers direct the various 4 letter designators to respective mail gateways in respective areas. As far as the Internet would be concerned wouldnt they just be considered as domain indicators that just have a relevent network attached in one particular part of the Internet? Here in Australia we have the top level domain of AU on the Internet (AARNet), mail for *.AU doesnt get sent to Europe, it gets sent to Australia, similarly if things like NOAM, CEAM and the other ones which I havent seen could indicate which region of the globe to point the particular gatewayed mail wouldnt that help the problem (and make gatewayed mail simpler so that say gatewayed mail didnt get dropped to the BBS net in the Middle of the US somewhere that was destined for Europe or Australia)?

(I just noticed that if the original BBS Addresses for Australia of state.AUS.AU had been implemented that the problem of Namibia would have cropped up a lot sooner (without the cost problem though) as *.AU is the top level domain here!, instead we actually use state.AUS.OC (OC= Oceania, South Pacific , New Zealand, Australia).)

Anyway I guess the bottom line is while we are arguing about this nothing is actually being done. I personally havent decided what I think would be the best way to go, I would like to see the proposal for the 4 letter designators and then take it from there.

Names are not routes nor networks. Multiple networks can reside in a same domain.

>There is no reason in particular why some .com or .edu
>addresses could not exist in Namibia.

And there is no reason in particular why some .jp domain addresses should not exist in the USA or Namibia or anywhere outside Japan, as long as the name is legitimately (i.e. registered in Internet DNS) resolvable.

>Repeat after me: NAMES ARE NOT ROUTES.

And names are not networks.

I propose to add a pseudo top domain (like .BITNET for BITNET). .AX25 is not bad, although I don't like it because it is a protocol name, not a network name.

>The name spaces should be disjoint. Names are not routes.

Haven't we been through this before? Internet host addresses are not tied to
routes. They are related to organizational structures. Sometimes those
organizational structures happen to coincide with geographical boundaries and
the top level domain names are chosen to match the geographical area.

The addresses on the packet radio network are already too long and
already contain redundant information. No need to make them longer.
Certainly you don't want to add an internet domain name to a
geographical route.

>2. Getting the BBS Net to change its addresses to the 4 Letter continent

I sincerely doubt that the internet would be willing to register a
geographical routing hint as a top-level domain, since names are not
routes.

But wait! You'll have to change the bbs software! After all, it
understands '.NA' now, not '.NOAM' or '.MOON'.

>3. Getting the BBS addresses to change the separator from a "." to a ":"

Hmm. You'd have to change the software for this one too. It would be a
nice clean change, though.

>4. Educate the users not to use addresses incorrectly.

Hah. Good one. Easier to herd cats.

>5. Develop accepted Gateway practices to handle the differences between
>   the two networks.

Gateways don't matter here; it's user misuse. The gatewaying problem is
already solved, should we care to ever do it.

This problem is in conjunction with my previous posting: I am
intercepting packets and changing some of the information in the

bodies; however, most of the time, the new data packet is different
in length than the original, so at someone's suggestion, I do a

ntohtcp...
 .
 .
 .
bp=pushdown(bp,newlen);
memcpy(bp->data, newdata, newlen);
trim_data(&bp,newlen);
bp=htontcp(tcph,bp,&ph);

the packet looks good up till the call to htontcp(). However, when htontcp
calls pushdown() to push down the TCPLEN, the bp that is returned is incorrect -
the original data in the bp becomes junk... this has something to do with
ambufw() I suspect. does anyone have any idea why?

as I said, this is in conjunction to an earlier problem - that of getting
the extra cut off segment at the beginning of the next or subsequent packet
bodies. if I do a pullup(&bp,NULLCHAR,oldlen) right before the memcpy,
I get this problem

thanks in advance, any help would be appreciated

Tony

Let me try this one more time as I didn't see any real comments the last time.

I agree that changing the separator in the name/routing designator is a bad idea.

I think the easiest and most effective solution would be to change the Continent
designators to 4 letters. To the best of my knowledge, there are currently no
4 letter top level domains in the Internet so uniqueness should be gauranteed.
Requesting ISO and INTERNET sanction for these should gaurantee that they
will remain unique in the future.

Can anyone give me a real good reason why this can't/shouldn't be done??

I believe that even though it appears to be impossible now, at some time in

the future, when political factions begin to realize that this isn't the 1920's,
the Amateur Packet System will be connected to the rest of the world. We
can't keep our heads in the sand forever.

I've been watching this one on and off, and seeing as how this nonsense is
*** STILL *** going on, I have to ask a few questions....

then, I'm going to ask/suggest something that may very well help (and it may
not).

none of this is meant as a flame --- please do not interpret it as such.

In article <1991Aug7.173525.27550@apd.mentorg.com> hank_oredson@mentorg.com writes:

> Well Marc, we (the bbs authors) await your suggestions.
> What is it we should do? How should we do that?

as has already been said at least a hundred-thousand times, follow the accepted standards. the argument that it doesn't work is false. I can see why this screwup might have happened in the first place --- the bbs software was written in a vacuum. at the time, perhaps this was considered ok, since it was intended to be used that way as well. now, however, that assessment is turning out to be wrong. fine. you know what they say, do it right the first time....or you have to spend twice as much time fixing it later. guess what.......

*** Ok, sounds good to me.
*** So   *WHAT ARE THOSE SUGGESTIONS* ?
*** " ... follow existing standards ..." doesn't tell me squat.
*** Please be just a tad more specific, and then *SEND ME THOSE STANDARDS*
*** Also, send the recommendations on how to USE those standards within
*** the bbs net ...

> While doing that (whatever it is) keep in mind that we
> wish to support only a small number of users (about 100,000)
> with only a small number of servers (about 10,000), and that
> those users will often have *NO* local processing capability.

first, WHO CARES if the users themselves have '*NO* local processing capability' --- granted, right now, I'm using a pc to pretend that it's a dumb terminal...but it basically has no say in the operations of the UNIX machine I'm working from. does that prevent me from sending e-mail and posting articles? no. it has nothing to do with it.

my dumb pc keeps sending bits to a far-away land. it knows nothing of what will happen to those bits, nor does it care.

now, as far as BBSs not having the smarts to do global routing....WHO CARES? my UNIX machine here (well, there.... :-)) knows nothing about routing mail beyond Amoco computers. in fact, it sometimes has problems with that (or did, at least). it doesn't matter. when my machine has mail to send that it doesn't know how to handle, does it just go off into a corner and sulk? no. it passes it along to another machine who has more mail routing information...like how to access non-Amoco machines.

after my machine sends the mail on to its server machine, that machine will then look at where the mail is headed, and if it leaves Amoco, it will pass it along to our Internet mail gateway, which....... you get the idea.

so even the local BBSs don't have to know how to route to everywhere in the world. all they need to know is where to send it if they don't know what else to do with it.

> So post some useful ideas please, since it sounds like you
> know what the solutions are.

ok. here's my final question, which can also be taken as a suggestion.
if I want to send mail, for example, to friends back in Aggieland on a
machine that is on BITNET from Internet, I would address it to
joe_user@tamvenus.bitnet --- notice the .bitnet? (yeah, I know....VENUS
is also on the Internet...but it's habit now.)

so, why can't we simply register something like '.packet' with the NIC,
and put all this nonsense to bed? then, make sure people know that if
they want to mis-use .NA and call it North America, they must also use
the .packet to let the system know it is for a foreign network. now, I
must admit that mail is not my strongest area --- sendmail.cf still scares
the sh_t out of me, but it seems obvious that this is a solution to this,
and will help in any attempts to interconnect the lot.

*** Thank you for volunteering to register the "packet" domain with the
*** NIC (whatever that is ...), we need volunteers like you to handle
*** these details. Please let us all know when that registration has
*** been accomplished, and what the "top level network domain name" is.

my packet address might then look like n5ial@wb9yae.chi.il.packet or
something like that. the gateway machines (if there are any) could
then say ``hmmmm....he's a .packet, and is in ill. --- he must therefore
be in .usa.na.earth.western_spiral_arm.milky_way.universe'' or whatever
it wants. who cares --- from that point, it would be leaving the Internet
machines alone. but while on the Internet, it would conform to standards.
the gateway machine has the smarts.

likewise, if I sent mail (mind you, this all assumes that such a gateway
exists) from packet to an Internet address in Nambia,.....

while on packet:
>From: n5ial@wb9yae.chi.il.usa.na.earth.western_spiral_arm.milky_way.universe
>To: user@machine.na.arpa

once on the Internet:
>From: n5ial@wb9yae.chi.il.packet
>To: user@machine.na

so what's the problem?

*** Thank you for volunteering to author the user documentation that could
*** be distributed within the internet and the bbs net to help educate
*** users on these addressing matters. We need volunteers like you to
*** create and disseminate this information !

oh, people would have to be sure that their .signature clearly points out
that their address is in .packet.

*** Thank you for making some suggestions on how people might structure

*** their signature to help users avoid confusion. Thank you also for
*** posting this useful information to all the pertinent news groups !

>   BBSNET, FWDNET, AX25BBS, AMPR.ORG).

The addresses on the packet radio network are already too long and
already contain redundant information. No need to make them longer.
Certainly you don't want to add an internet domain name to a
geographical route.

*** Agree. Small nit: it's a hierarchical LOCATION, not a ROUTE.
*** That is, it describes where the server is located, but does not
*** describe how to get there. That is why I've called it "routing
*** hints" as opposed to "routing" ...

>2. Getting the BBS Net to change its addresses to the 4 Letter continent
>   designators and have these registered with the Internet (On this point
>   could some kind soul post the 4 letter proposal to the network or at
>   least EMail me a copy?) A question I have here is, what is involved
>   with registering these 4 letter designators? Are there any costs?

I sincerely doubt that the internet would be willing to register a
geographical routing hint as a top-level domain, since names are not
routes.

But wait! You'll have to change the bbs software! After all, it
understands '.NA' now, not '.NOAM' or '.MOON'.

*** No, the software does not understand any particular set of characters.
*** This is totally configurable. Nothing to change except some entries
*** in a runtime configuration file.
*** However ... see 4. below. We would still have to "herd the cats".

>3. Getting the BBS addresses to change the separator from a "." to a ":"

Hmm. You'd have to change the software for this one too. It would be a
nice clean change, though.

*** Yes, the software would have to change, and also be backward compatible.
*** Not a big problem, were it desirable.

>4. Educate the users not to use addresses incorrectly.

Hah. Good one. Easier to herd cats.

*** Yup. MUCH easier.

>5. Develop accepted Gateway practices to handle the differences between
>   the two networks.

Gateways don't matter here; it's user misuse. The gatewaying problem is
already solved, should we care to ever do it.
     - Brian

*** I'm not convinced the gateways are really ok, but have not seen
*** problems that are obvoius "gateway problems" ...

>Rather than let this drop, lets take irony in hand and explore a bit:

>Ok ... now everyone has had a chance to hack at this topic, I have this
>one kinda strange question ... how come internet has no top level geographic
>domain specification? If internet addresses were things like mumble.NA.AF
>then the problem would not have occured ... seems to me the problem occurs
>because internet has fewer layers in it's domain hierarchy than the bbs net.

All together now, in chorus: in the Internet, NAMES ARE NOT ROUTES.
Names are names, that's all. Domains are administrative units, NOT geographic
units. ".edu" generally means a university, WHEREVER it may be. ".com"
generally means a commercial enterprise. There are servers that can tell
you how to route to any name.

*** Names are not routes, routes are not locations, et al.
*** Domains are not "administrative units" in all (or even the most
*** common) cases. Perhaps something else unique to internet.
*** Yeah, we all know this. However (and there is always a however),
*** names are frequently chosen in some mnemonic manner to make it
*** simple for humans to deal with them. e.g. "STANFORD.EDU" and
*** "kaufman" for example. Ditto the bbs net hierarchical location
*** identifiers. They look like a location for a reason ...

Country codes as domains usually occur only for very small countries, where
everyone in the country (using that domain) uses a common server for
routing information. There is no reason in particular why some .com or .edu
addresses could not exist in Namibia.

*** "usually" ... you mean "usual, in the internet"?
*** In two other common examples (telephone and post office) they
*** occur at any time the information must cross a geopolitcal boundary.

>In fact, if internet were to simply add that top level (continental) domain
>name, then the problem would never occur, since Namibia would be mumble.NA.AF
>on the internet, and mumble.NAM.AF on bbs net. This would be much simpler
>than making a similar change in the bbs net, as the internet has standards
>and an organization to disseminate them. The bbs net has neither.

The only reason to add a domain of the form ".AF", would be if someone wanted
to coordinate addresses and routing for all of Africa, which I doubt.
If the bbs net does not have standards, how come everyone uses ".USA.NA" in
the continental US?

>Of course, if both networks chose the SAME standards, then there would never
>be a problem ... or would there ?

There might be less problem. Now, since bbsnet has maybe 10K nodes and
100K users worldwide, perhaps it should be the one to adopt the Internet
standards, since there are 100'sK nodes worldwide, and established gateways
to other networks of comparable size.

*** I suspect there would be a great deal MORE problem ...
*** Think it through carefully ...

>It sure has been nice to see the educational information posted to
>rec.radio.amateur.* and other appropriate places ... oh wait ... time warp ..
>those postings have not occured yet !

Au contraire. You just haven't been reading the groups long enough.

*** When did this information appear?
*** I've been reading for about 10 years ... but have only recently
*** acquired the ability to post (new job, new location, better
*** internet access).

>Come *ON* someone! Plenty of folks to complain about the problem ...
>but nobody to explain the solution ?

Repeat after me: NAMES ARE NOT ROUTES.

*** Lessee now ... WHO are you quoting here?
*** Might be most interesting to discover the attribution.
*** The actual quote is (approx, it was a long time ago)
*** "A location is not a route."
*** and one could add "... and a name is neither".

> ... Hank
>Hank Oredson @ Mentor Graphics
>Internet : hank_oredson@mentorg.com
>Amateur Radio: W0RLI@W0RLI.OR.USA.NA

If I accidently fire your AR address on the Internet, the mailers will say:
Gee, I don't know how to route that, lets ask the domain server for the ".NA"
domain. It would be preferable for your address to be something like:
W0RLI@W0RLI:OR:USA:NA, so an Internet mailer would say: Gee, that's not an
Internet address. Let's tell the user rather than send it somewhere strange.

Even adding ".ax25" would be an improvement, as long as you ALWAYS advertised
your address as: W0RLI@W0RLI.OR.USE.NA.AX25 so that Internet mailers would
never be able to match the last component as a valid domain name.

The name spaces should be disjoint. Names are not routes.

*** Standard set of comments thanking you for volunteering to administer
*** (or to consult with appropriate bodies which administer) the name
*** spaces ...

Marc Kaufman, WB6ECE, (kaufman@Neon.stanford.edu)
Names are not routes.

*** Gee Marc ... glad you understand that names are not routes. Hope
*** you also understand that they are not locations, etc. etc.

*** Also hope you understand that names are often USED to REPRESENT
*** routes or locations or affiliations or domains or ...
*** This is the way it is ...

In article <1991Aug12.223429.29535@APD.MENTORG.COM> hank_oredson@mentorg.com
writes:
>how come internet has no top level geographic domain specification?

It does. The ISO two-letter country codes. No additional information
is needed for routing because a tiny lookup table (one that will
easily fit with the other software on a 256K 4 MHz PC) is sufficient
for routing.

Also, their routing isn't really geographically based. For example, GE sites in Europe have a US GE site as their gateway -- even if the original traffic originates at a non-GE site in for example the UK it must go to the US before being sent to the recipient European GE site.

>This would be much simpler than making a similar change in the bbs net...

Not hardly.

There are probably 100 times more sites on the Internet than on the bbs net (making the scale of the change a whole lot larger) and there is no mechanism to enforce Internet standards on the Internet so there would be no possible way of making a smooth transition. Additionally, they don't need any such change.

*** I still think it would be simpler. There are mechanisms in place
*** to notify sys admins of the changes, to disseminate information
*** about the changes, etc. This mechanism is not yet in place in
*** the bbs net ...

>It sure has been nice to see the educational information posted to
>rec.radio.amateur.* and other appropriate places ... oh wait ... time warp ..
>those postings have not occured yet !

This is really harsh.

I emailed you how to get the full set of Internet standards and received an email reply from you which confirmed that you got my informative email. The whole text of all Internet standards is far too large to post to the net under the USENET rules.

*** And I thank you. Have attempted to retrieve one, to see if
*** the system works. Have no response yet.
*** It was not intended to be harsh, just sarcastic. It was not
*** pointed at any particular person. There has been lots of
*** discussion of the 'probolem', but as of yet, little educational
*** material distributed to the PDU.

>but nobody to explain the solution ?

I have repeatedly explained at least a couple of solutions and others have as well.

Drop continents and add a tiny routing lookup table OR replace them with 4 country codes.

*** But who have you explained them to? Please please send this kind
*** of information out into the bbs net !
*** Not a "tiny" lookup table. LOTS more than the (typical)
*** order of 2-3 k bytes currently required.
*** Nothing required of the code though, it already would handle
*** things this way if people chose to.

  Also, get Amateurs participating in the PBBSnet to clearly mark the
difference between their Internet address and their Amateur Radio PBBS
address in their .signature files in postings and in email sent over
the Internet. Such a suggestion could easily be placed in future
releases of the PBBS software and prevent future problems.

*** Ok ... send me the file, I'll include it in future releases of my code.

No reason at all, except that of a sceptic like me who says that this
solution is so obvious that it will fall by the wayside. Problem is,
folk are looking at deep technical gateway theories, and have not
had the clarity to see the problem as you do.

If .NOAM is used, and gets registered as top level domain, and the
.NA nameserver gives a CNAME for *.USA.NA -> *.USA.NOAM, then
hopefully things will sort themselves out over time.

Mike

Does anyone know of a good, CHEAP source of the 16550AFN uart chips? I just had a lightening strike that took out ALL my rs232 stuff (I think the EMP got them) and the best price on the '550s so far has been $30! I need at least 4.

Thanks,

Well ... guess this needs explaining again.
A location is not a route.
An address is not a location.
A name is not an address, location, or route, although
it may be USED as any of them, or may be mnemonically
related to any of them.
Each end user exists in many (possibly disjoint) domains.
e-mail addresses tend to make use of one or more of those domains.

Haven't we been through this before? Internet host addresses are not tied to routes. They are related to organizational structures. Sometimes those organizational structures happen to coincide with geographical boundaries and the top level domain names are chosen to match the geographical area.

*** And why not add a top level domain to those addresses?
*** One example might be ".internet" ... to keep it clear

There has been quite a number of suggestions as to what to do about
this problem. Suggestions seen have included,

1. Adding a "Domain" or "Network" or whatever you like to call it name
   to the existing Amateur BBS addresses. (suggestions seen include
   BBSNET, FWDNET, AX25BBS, AMPR.ORG).

*** I think this might be viable, but hard to convince the users.

2. Getting the BBS Net to change its addresses to the 4 Letter continent
   designators and have these registered with the Internet (On this point
   could some kind soul post the 4 letter proposal to the network or at
   least EMail me a copy?) A question I have here is, what is involved
   with registering these 4 letter designators? Are there any costs?

*** The only problem here is supporting the two naming systems for
*** the transition period, and getting the word out.

3. Getting the BBS addresses to change the separator from a "." to a ":"

*** I don't think this really helps, and might be a huge education problem.

4. Educate the users not to use addresses incorrectly.

*** Amen !

5. Develop accepted Gateway practices to handle the differences between
   the two networks.

*** Hello out there gateway folks ! Are you reading this?

All seem quite good ideas, of these I tend to favour 2, 4 and 5
collectively but am still undecided.

Someone noted that addresses like *.UUCP and *.BITNET are not actually
domains. But they appear to be effective, why not implement something like
that? Or use the 4 letter designators. In some ways the 4 letter scheme
could work better as although the Internet is Domian and name based I cant
see why a location couldnt be specified and have internet mailers direct
the various 4 letter designators to respective mail gateways in respective
areas. As far as the Internet would be concerned wouldnt they just be
considered as domain indicators that just have a relevent network attached
in one particular part of the Internet? Here in Australia we have the top
level domain of AU on the Internet (AARNet), mail for *.AU doesnt get
sent to Europe, it gets sent to Australia, similarly if things like NOAM,
CEAM and the other ones which I havent seen could indicate which region
of the globe to point the particular gatewayed mail wouldnt that help
the problem (and make gatewayed mail simpler so that say gatewayed mail
didnt get dropped to the BBS net in the Middle of the US somewhere that
was destined for Europe or Australia)?

(I just noticed that if the original BBS Addresses for Australia of
state.AUS.AU had been implemented that the problem of Namibia would
have cropped up a lot sooner (without the cost problem though) as
*.AU is the top level domain here!, instead we actually use state.AUS.OC
(OC= Oceania, South Pacific , New Zealand, Australia).)

Anyway I guess the bottom line is while we are arguing about this
nothing is actually being done. I personally havent decided what I
think would be the best way to go, I would like to see the proposal
for the 4 letter designators and then take it from there.

*** Second the opinion.
*** Where are those proposals for continent names?
*** Is there a standard we can refer to?

I've made some minor updates to Poor Man's Packet and have released version
1.1. If you are happy with 1.0, it is probably not worth snagging, but here's
a summary of changes:

- bug fixes: autowrap, machine crashing when left monitoring
  for extended periods of time
- documentation: all .CFG commands are now documented in PMP.DOC,
  misc. edits and updates
- source: misc. cleanup, removed most of the obsolete debugging
  code

PMP 1.1 is available via anonymous FTP from helios.tn.cornell.edu in /pub:

pmp11.zip
pmpsrc11.zip

If you have questions or problems, drop me e-mail.

Right, but what's your point? Aren't we discussing how those names are being
misused in a PARTICULAR environment?

>*** And why not add a top level domain to those addresses?
>*** One example might be ".internet" ... to keep it clear
>*** within what domain the name might be interpreted as an

Several people including myself have already proposed a switch to .NOAM. I've
even gone so far as to implement that at our local gateway. The problems we're
discussing occur not because your hierarchal addresses don't have a top-level
domain (love those double-negatives...). They occur because a particular

continent routing designator conflicts with an existing Internet domain.
I fail to see how adding a top-level domain on top of the hierarchal route
will make things SIGNIFICANTLY simpler than just changing the .NA or using a
different separator character.

I run a gateway, and I'm NOT convinced...

Hank , W0RLI, has several times requested some suggestions for
a solution to the bbs addressing problems. Here is my suggestion..

Go to a domain-style addressing scheme using the domain name
"ampr.org". This has the advantage of being already in use by
the ham tcp/ip community and also being compatable with internet
addressing standards. A complete address would then be "call@ampr.org".
Calls are guaranteed unique. Ampr.org is unique. The fact that
this is also a tcp/ip "name" does not matter, as the nameserver
scheme that I am about to suggest will be an *ax25* service
mapping to an *ax25* address.

In answer to the problem of computing power needed to have a name-server
based addressing scheme, it is not necessary to have serious
computing power *at each site*. Establish in each region a
"nameserver" or "hub" bbs. Only these bbses would have to employ
enough processing power to do name look-up. Simple, "local" bbses
could now use less complicated software that need only make one
type of routing decision: Is this for this bbs or for another? If
the mail is not local, it gets sent to the "hub" bbs, which, with
it's greater processing power, can do a table look-uo and send
the mail to the appropriate "hub" bbs for the destination of the
message. Perhaps the "hubs" could use the Internet for a backbone
initially until 56K links really start to be a reality.

Something else that suggests itself is that, with greater control
of how mail and bulletins flow on the "network", and a guaranteed
"serious" processor at the hub bbses, it should be possible to
keep lists of bulletins at the hubs, eliminating BIDs and
that complexity from the local bbses. If there is only one
way in or out to the network, you can exercise a lot of control
that you don't have in a "free for all" situation.

Updates to the nameserver lists would have to be sent on
a regular basis. However, these would only need to be sent
among the "hubs", reducing the bandwidth needed to send updates.

I had originally suggested placing a high order name like "axbbs"
on the present packet addresses. I have become convinced that
this is really just a band-aid. What we end up with is a scheme
that is partially source-routed and partially domain-style.
I don't think this is good.

Anyway, this is my suggestion. If you break the thing down to where
most bbses can run 4.77 mhz XTs or Color Computers or C64s and
you need only one '386 or Sun or whatever in each region, then
domain-style addressing certainly could be made to work on
ham radio. A large portion of the networking world uses this style
of addressing. I am afraid that ham radio will certainly be left
out in the cold unless we "get with the program".

Certainly, this scheme would have to be implemented in parallel
with the existing bbsnet. We can't just shut down and change it
all over. What I'm suggesting would be an entirely new network
that would develop alongside the present network.

Hello,

As far as FTP, you can find it on tomcat.gsfc.nasa.gov in the directory of bbs/aa4re under the file name of mbbios35.zip. If you don't have FTP access you can get it from my telephone BBS at any of the numbers listed below, and it will be in the ham/aa4re directory under the same file name as listed above. Here are the telephone numbers, and the BBS is open to all.

my apologies if this somehow gets posted twice....our server zapped out
of existence for a minute, and this APPEARS to have aborted.

well, I could, but it occurs to me that you are quite capable of getting
them yourself via anonymous ftp. ftp to one of the sites that maintains
up-to-date listings of RFCs, grab the index first, and look for the RFCs
that describe the info you're looking for. then, ftp the appropriate RFCs
themselves.

I trust you know what ftp means? do you know how to use it?

>*** Thank you for volunteering to register the "packet" domain with the
>*** NIC (whatever that is ...)
[remainder of form-note deleted]

whatever that is? if you don't know what the NIC is, you are certainly not
among the group of people writing BBS/e-mail software, so why worry about
it?

oh, and I don't recall volunteering. did anyone else read that in my post?
or is this just a load of random typing on someone's part that ends up
almost looking like a news post? (odd format, though)

If it is decided to make the PBBSNet a zone within the ampr.org sub-domain,
I think we will need to actually give it it's own zone. The question that
this poses though is, should ucsd.edu be the primary DNS for that zone, or
should there be other primary DNS's for that zone, given that the PBBSNet is
(sort of) administered geographically.
e.g. All PBBSNet machines fall into the pbbsnet.ampr.org zone,
     All American BBS's fall into the na.pbbsnet.ampr.org zone,
     All British BBS's fall into the gbr.pbbsnet.ampr.org zone,
     and so on.

That way, the existing (and usually faster) mail systems would handle the
bulk of the mail DESTINED for the PBBSNet FROM the Internet, and vice versa.
Also, it would be easier to maintain the pbbsnet sub-domain with regional
primary zone servers.

Anyhow, I think we need to differentiate between Tcp/Ip ampr.org (i.e.
existing) hosts, and those which MUST pass through an SMTP<-->PBBSNet
gateway. Naturally, a NOS or MSYS host could perform as that gateway, and
therefore _could_ belong to more than one network.

Comments?

Whoops! - That should have read:-
       All American BBS's fall into the usa.pbbsnet.ampr.org zone,
and not na.pbbsnet...

As has been said previously, the use of a continent designator is redundant. Someone suggested that it lowers the overhead on the individual BBS's from having to determine which continent is the next hop in a path, but surely the continent information can be stored locally on each BBS and some hashing algorithm (if you wanted to be fancy :-)) used to look up the countries continent if you feel it _must_ be determined.

What noone has yet mentioned (at least I haven't seen them mention) is just how much extra bandwidth is consumed in virtually EVERY message passed between PBBS's because of the continent designator. Surely, that extra time saved by NOT sending the continent in each message would more than makeup for the time taken to do the lookup...

Oh well, I'm ready to duck :-) :-) Fire away!

There are probably more folks on BBSnet (who do not have access to
USEnet) that can add much to this discussion. I agree with Hank.

Let's move the discussion to BBSnet.

'Sides...I will soon lose my news account, and this is important
to me.

I got all the stuff (complete kit) from the folks yesterday. (actually it came
last week while I was on vacation). Went flying for a couple hours, then started
on assembling it. I got it all together in about an hour. Started the test
procedures
as recommended in the article. Found I put the 5V reg in backwards. Took it out,
turned it around and prayed. Measured the voltage, and the meter ssaid about 8V
(darn I blew it up), well looking around I remembered the board isn't plated thru
the holes, and I forgot to solder the top. Now the meter is saying over (on the
20V
scale) couple other checks, and the meter is diagnosed as flakey. 200V scale,

reads
5.1 volts (whew).

Tuned it up according to the instructions, and I am getting all the good RX indications
and everything looks good. Just not getting any text to show up. It was pretty late
and I was really tired (recovering from vacation and all).

Hints. Be careful, follow the instructions. I had the regulator in backwards, and If
the modem chip were installed, I would have to wait a couple days for a replacement.
Use a longish cable for connecting the modem to the radio. I have a 3" cable on the
recieve side, and I am forever knocking the radio about.

The software looks great! I am really impressed, they really put a lot of trouble
into making the PMP program easy to use. The screen looks scary, but ALT-H provides
all the answers.

I'll keep you informed

Nntp-Posting-Host: localhost

I ran just such a BBS for years, here, but a lightening strike wiped it out.
Now that I'm starting over, I have a problem between MBL and BPQ that's driving
me batty! Either MBL isn't sending a break, or BPQ isn't obeying it. The
symptom is that when a user connects, he gets:
*** connected to WA4ONG
conok off
mon off
[MBL whatever]

..etc

The TNC commands are being sent to the connector, instead of the TNC!
The same problem exists on forwarding, the BBS does a C SWITCH, then sends a
TRAN to the node, which calls it an unknown command! Then the BBS goes on
forwarding, but in non-transparent mode, i.e. one line per packet!

I MUST have something set up wrong!

(I've tried bpq 4.03a and 4.04, both act the same!)

Netsirs,
Would you describe a VHF station that I might set up to QSO
with U5MIR? I was able to hear him on voice and a few CQ packets
last Saturday morning, and I would like to make a connect.
I am wondering what sort of power / antenna / tracking I might
need. I'd like to build as much of it as is reasonable, but any
suggestions would be greatly appreciated. BTW, I was using my
Kenwood TH25AT, with a 1/4 wave ground plane antenna (from the
ARRL Handbook design), with a Kantronics TNC / Laptop.
Should I buy a brick? Build a helical antenna? or a Yagi?
Will my YL kill me when I bring this stuff home? (Why ask why :-)
Thanks in advance,
David, N5TLZ

I'll move very soon to Houston Tx and i am looking to some information
on packet activities in the area. My basic questions are the following:

What are the major BBS in west Houston or in Sugarland.
Have they 9600 Bds access?
Who is the TCPIP coordinator for the area?
How is the forwarding between Houston and France (or Europe ,or Quebec)?

First, let me apologize for the strident tone of my last posting. I really
have nothing personal against Hank, and I am even one to appreciate all he
has done for the amateur BBS community.

*** Ok ... I'll also appologize for my flame ... (ain't this fun!)

However, there are some folks out there who just do not understand the issue.
for example:

kurt@neuron.cs.tamu.edu (Kurt Freiberger) writes:

> OK, by the same token, all other mail systems in the world, if they want to
>gateway into the Internet, must change their addressing scheme to match the
>Internet?? N.F.W.!!!! As a W0RLI BBS op for many years, I can say that
>traffic went very well all over the globe, thank you, WITHOUT the "benefit"
>of the Internet. Hank did a damn fine job with his stuff. It worked.
>To change the whole BBSnet to a "compatible" addressing scheme would mean
>that all of the BBSes, simultaneously, would have to change to the new code.
>Get real! It'll never happen. And, why should it?

I *DID NOT SAY* that the BBS adressing scheme should be compatible with
Internet. In fact, what I *DID* say was that the BBS addressing scheme
should *NOT* be compatible with the internet -- in the sense that a BBS
address, if inadvertently used to address a piece of mail on the Internet
(by a confused or naive user) should *NOT* accidently route to places like
Namibia, that cost real money to unsuspecting end users (in Namibia) who
have no desire to play amateur radio games.

Once again: this is *NOT* a gateway issue. Gateways can do (almost) anything.
This is a *USER CONFUSION* issue, where a user uses the wrong address for
the network he is on. It is akin to the UK folks writing their addresses
backwards. No one cares, in general, if a few pieces of mail get bounced.
However, this confusion is costing real people real money.

*** It is indeed a gateway issue. It is ONLY at the gateways that
*** the networks meet. The gateway must know about addresses on

*** either side of the gate, and do the "proper thing" with them.
*** The issue of user eductation remains the same, in both networks.
*** Attempting to call me on the telephone by dialing my home
*** address simply will not work, nor will it work very well if you
*** attempt to send mail to my phone number, or send me an internet
*** message by using my bbsnet address.

The BBS folks deliberately ignored the pleas of the Internet folk to adopt
a different address syntax when geographic "routing hints" were first
adopted. Because of this, I think the BBS folks have the primary
responsibility to alleviate the confusion. If you don't, even the gateways
will be denied to you (cf: the Japanese FWD-NET).

*** What pleas? "We" not only heard nothing, we got NO cooperation
*** in the form, for example of providing copies of the pertinent
*** standards. Now, some 4 years after the initial bbsnet implementation,
*** we find there is a problem ... this is not a big surprise.
*** So ... send us some standards documents ... then we can read them.

hanko@apd.MENTORG.COM (Hank Oredson) writes:

>1. Think you miss the point.

Actually, Hank, it is YOU who miss the point. The problem is NOT the
gateway function, it is that bbsnet has deliberately adopted an address
syntax that will often "work" on internet, albeit incorrectly. This,
coupled with naive users, can and does lead to mail sent to, e.g. Namibia.
Now, no one would give a hoot about this except that it is costing the
Namibians real $$ money to receive and bounce (or ignore the mail).

*** Sorry, I'm not in charge of anything at all within internet.
*** As with everything else, ignorant users will make a mess.
*** That's too bad, and can only be changed by education.
*** Please post some education.

>3. There is no chance that the bbsnet will change it's address grammar.

Thanks for your cooperation. That's what makes Amateur Radio great.
You're the one primarily responsible for relegating amateur radio protocols
to the lowest possible levels that a 512K PC-XT can support -- and be
damned with the rest of the world. Amateur radio does not stand alone, and
you can not pretend that the decisions you make (e.g. re: geographic
routing) are irrelevant to the outside world, because users "should know"
the difference.

*** "Cooperation"? What is it you would like me to do?
*** Now that you have told me what *NOT* to do, tell me what
*** it is I *SHOULD* do.
*** i.e. you didn't say anything useful here ...
*** Anyway ... the problem is not in the grammar.

>So we have this problem ... users mostly don't understand much of the
>above. My suggestion is the same as yours: education. No matter
>what we do with the software, users will make mistakes. I'm trying to
>get more involved here on usenet because I'll probably write more software ...

Well, just what are YOU going to do about educating YOUR users to not use
bbsnet addresses on Internet?

*** "MY Users" have never used a bbsnet address on internet.
*** Probably never will, since the only user on this machine is me,
*** and I *DO* understand the issues.

Marc Kaufman (kaufman@Neon.stanford.edu)

*** Well Marc, we (the bbs authors) await your suggestions.
*** What is it we should do? How should we do that?
*** While doing that (whatever it is) keep in mind that we
*** wish to support only a small number of users (about 100,000)
*** with only a small number of servers (about 10,000), and that
*** those users will often have *NO* local processing capability.
*** So post some useful ideas please, since it sounds like you
*** know what the solutions are.

100% agreed. The structure of domain naming system is totally independent from
physical topology. A domain can contain multiple networks. (For example, in
DEC, there are at least two IP networks for external connection, and a huge
internal DECnet world, all named under the same domain "dec.com".).

Hank,
 There have been a couple of suggestions that I have not seen you say
why they should not be implemented, other than that the small number of hosts
running a compatible PBBS might have to change.
(1) Drop/change the continent specifier. As you are proud of pointing out,
the country codes you use are from an ISO standard. But, as you sometimes
admit, you picked/made up the continent codes all on your own. The new
list you just posted will, I think, cause even more conflicts.
(2) Change the character separator, ".", to something like ";" -- or
whatever. The '#' was added for parsing ease; why not change the period?

As far as "users" and processing power, the end stations probably don't
need any more. And even a vanilla 512K PC can store routing entries for
 ~130 countries.

Last, a minor flame. There is only one (other) semi-major email system I'm
aware of that mimics (kinda) RFC822 addressing, but is not the same and
causes much confusion among new users -- the British JANET. Everyone
else (even phone BBS's) uses a clearly different syntax & that HELPS
connectivity and user education!

Willis Marti n5szf

>   packet-radio domain, but until we get more buy-in from die-hard
>   NETROM/PBBS/AX.25 addicts, progress is going to be slow and tedious.

>   Until we "ivory tower types" can get a decent highspeed/modern network in
>   place, there is little point in providing whizzo services.

My comment re purists/theorists/network purity/service elements was a
tongue-in-cheek jab at Brian Kantor, which I knew he would chortle at
as he and I have had this discussion before - I think one can concede that
there is a place for theorists, implementors, and the other fools who try
to break everything.

Now Marcus, as to my holding up the packet bbs network "as a shining
example" - what a tight-ass you are ! I never held it up as anything but
another example as to how mail can be moved.

I think what is a little obvious by now is that:
1) there are folks who do believe that there was no mail service/e-mail
   before UNIX and the INTERNET - I refer you to previous messages - and
   this just ain't so,
2) some folks have mistaken RFC's for STANDARDS - they are not - they are
   Requests For Comments - they may have become de facto "standards", but
   they tend to be limited to the INTERNET,
3) some folks believe that the only way to do things is the INTERNET way,
   and there are obviously some big-hitters who disagree, or the ISO
   would not have any steam - (N.B. I claim no allegiance, I am just making
   a point),
4) some folks other than you will never do ANYTHING until everything is
   perfect - by then we won't need their help.
5) some folks on the INTERNET really believe that the BBS network wants
   to push mail thru the INTERNET - this is not particularly true - if it
   works to everyone's mutual benefit, and it is not a major problem, then
   fine - but I doubt we will instantly rearrange a system that is working,
   despite it's shortcomings.

I'm sure that points 6, etc. could follow, but that expresses the view-points
of a few folks who dropped me personal notes ... they too are tired of hearing
how the only way to do things is the internet way.

Hey, I like the INTERNET, and I enjoy the services. It is a wonderful
accomplishment, and when I use it, I play by its rules. But I also want to

take my destiny in my own hands and be part of something new and build a network - we are doing that. And you are too, with the 56k stuff ... great.

And then the final hurtful slash ---

> It's very sad that an IP address coordinator has such narrow vision.

I would suggest to you that perhaps it is YOU who have tunnel-vision -- you want to ignore what everyone else is doing, and like some folks on here, you want to ridicule what you do not use or do not undertand -- it does you no credit, as I know you are quite competent.

> Marcus Leech, 4Y11 Bell-Northern Research |opinions expressed
> mleech@bnr.ca P.O. Box 3511, Stn. C |are my own, and not

We'll this has got to be a frequently asked question, but....

What are some of the gateways to send e-mail from the internet to the packet network?

Thanks for any responces!

Hi. I'd like to use packet radio to connect my workstation at home to my workstation at the University.

I'd appreciate any pointers as to:

* What sort of license do I need (new code-free sounds nice)?

* How much does the equipment cost?

* How far can I go (I am moving about 17 miles and over a hill from the campus)?

* Is there an existing TCP/IP implementation for packet radio that will run on my Sun?

* What's the first thing I should do to get started?

Many thanks, DL

I have been trying to compile KA9Q with Turbo C++ (2.0) and the executable seems to be larger than the one that is compiled with Turbo C, not only that it doesn't work! Does anyone know if there is a patch for KA9Q for Turbo C++....and how do I contact Phil Karn?

Thanks,
John

I'm planning to port KA9Q from PC-DOS to a multiuser OS. My questions is
what type of copyright will I be violate if I modify the program? (estimate
percent of change is around 40% to 60%). I am interest in getting a
respond from the author and anyone else on this subject.

> that all of the BBSes, simultaneously, would have to change to the

It would not - were we going to switch to "compatible",
"incompatible", "impossible" or "impractical" addressing scheme,
doesn't make much of a difference. Have you ever heard of System ID
handshaking between BBS programs?

> Get real! It'll never happen. And, why should it?

Well, actually, why not? Even though I think this argument is rather
silly (and about silly users, not gateways), it wouldn't require much
patching to the existing software. There are new versions coming up
all the time anyway.

A colon (:) as a routing separator would be fine. But, o' the mighty
BBS programmers, pleeeease do NOT get too inventive about that. Leave
out | and \ and other peculiarities that look a whole lot different in
here...

|>

Actually, (1) is all that is necessary. This is not a routing problem. It has
nothing to do with gateways between PACKET <-> INTERNET. It is simply
a problem of having non-unique top level domain. Unless I am unusually
blind this morning, it appears to me that merely changing the 2 letter continent
designators to some 4 letter code would solve the whole problem AND make
routing/gatewaying easier by making the last part of the domain easier to
differentiate.

Carrying it one step further, you could even apply to ISO for official recognition
of the 4 letter continent designators you choose. Thus making it official.

|>   this just ain't so,
I'm certainly not one who believes that the INTERNET/UNIX are the only
  mail systems in existence. The INTERNET has, however, been around for
  longer than the packet radio PBBS network. If you really knew me, you would

know that I've designed network mail systems for non-homogeneous systems
that are distinctly un-UNIX like.
I have no sentimental attachment to either the INTERNET or UNIX.
I think they offer some powerful paradigms that others
(e.g. the amateur packet radio community) have been reluctant to accept
--simply because they want to do something "different" and not necessarily
better.

|> 2) some folks have mistaken RFC's for STANDARDS - they are not - they are
|>   Requests For Comments - they may have become de facto "standards", but
|>   they tend to be limited to the INTERNET,

So to you, then, the only "real" standards are those that are decided upon by
unwieldy committees of stuffed-shirt politicians in Geneva? De facto
standards are a way of life in the computing business. Lots and lots
of really useful things get done this way. In fact, the only difference
between most de facto standards and "real" ones, is that for "real" ones
you have to pay ISO a lot of money to get a *paper* copy of the standard.
A standard is, after all, simply a formal statement of a technique or
procedure that a large number of people can agree upon and use. I'd say
that pretty much describes the RFC process...

|> 3) some folks believe that the only way to do things is the INTERNET way,
|>   and there are obviously some big-hitters who disagree, or the ISO
|>   would not have any steam - (N.B. I claim no allegiance, I am just making
|>   a point),

The ISO is an important organization. It also consistently makes mistakes.
It bothers me that they believe that they are inventing something
something brand-new with OSI. They have a long history of ignoring
"prior art" and inventing something that is in large part inferior to its
predecessors.

|> 5) some folks on the INTERNET really believe that the BBS network wants
|>   to push mail thru the INTERNET - this is not particularly true - if it
|>   works to everyone's mutual benefit, and it is not a major problem, then

|>

Some folks believe that until INTERNET applications prompt with:

```
VE3XXX:  A,B,C,D,E,F,G,H,I,J,K,L,N,R,S,T,U,V,W,Z,? > ,
```

there is no hope that they will be accepted by the amateur community.

If that *is* true (which I don't believe) then I had better pack up my toys
and go play somewhere else.

|>
|> take my destiny in my own hands and be part of something new and build a
|> network - we are doing that.

If you think that the PBBS network is something new and wonderful, I think that
perhaps the sixties were a bit too good to you ;-) I think that the INTERNET
has a very rich application set that we can use to good advantage on a
totally-revamped amateur-packet-radio network. It offers a number of
appealing paradigms that can be made to work on the (as yet non-existent)
high-speed amateur-packet-radio network of the (near, I hope) future.

|>
|> ... you want to ridicule what you do not use or do not undertand -- it

|> does you no credit, as I know you are quite competent.
Where, exactly, do you get the notion that I don't use the PBBS network?
I use it frequently, which is why I want to replace it with something better.
I also understand its motivations, and many of the decisions that were made
  in its design. See some of my initial comments with regard to network-mail
  system design...
|>
|> Oh, congrats, I see you are employed again.
|>
Uhhmmm. I'm not exactly sure how to interpret that remark. I'll assume
  you're being pleasant and say thanks. I'll also point out that it's
  old (18 months) news.

Ok, what are examples of intersystem and/or internetwork electronic mail that
predate those?

|> 2) some folks have mistaken RFC's for STANDARDS - they are not - they are
|>   Requests For Comments - they may have become de facto "standards", but
|>   they tend to be limited to the INTERNET,

This is essentially completely wrong. When the US (and some non-US countries)
specifies the RFCs in procurements, and many major corporations plan or build
to them, they're standards. If you don't know what the abbreviations IAB
and IETF mean & their relationship, they you don't understand the process
enough to make an intelligent comment.

|> 3) some folks believe that the only way to do things is the INTERNET way,
|>   and there are obviously some big-hitters who disagree, or the ISO
|>   would not have any steam - (N.B. I claim no allegiance, I am just making
|>   a point),

You're 1/2 right -- there are *lots* of ways (some even "good") besides the
methods given in the RFCs. But the ISO protocols are there as "the next step"
in networking. Some ISO protocols are built to work with the TCP/IP suite.
And many "Internet" folk are integrating ISO ideas into Internet standards,
instead of claiming that the existing methods are "the best" and resisting
change (like some here).

|> 4) some folks other than you will never do ANYTHING until everything is
|>   perfect - by then we won't need their help.

The issue is not "instant" rearrangement. The issue is whether BBS folk are
interested in moving at all.

|>
|> I'm sure that points 6, etc. could follow, but that expresses the view-points
|> of a few folks who dropped me personal notes ... they too are tired of hearing

And I'm tired of hearing that the current mail system is the only way to
work in amateur radio BBS mail. The Internet standards are not the only
way to do things, but they have connected more systems of more different
types in actual working environments than any other protocol suite. And
they deserve to be considered, not rejected out-of-hand.

|>

Though these comments were directed to Marcus, let me say that I use the
PBBS mail system, think I understand many salient points -- and still think
the "tunnel vision" is exhibited by those who go off on their own & ignore
existing work. No one has ridiculed the W0RLI BBS code -- they've made
comments that maybe it should be changed.

Can't answer why it doesn't work -- I've done it with TC 2.0 & TC++ 1.0.
But a *major* part of the size difference is that Phil runs PKLITE on the
executable (which reduces it about in half).
If you have Internet access, you can ftp it from wsmr.simtel20.army.mil (or
a couple of other places). Or check your local phone BBS.

Hi, I am newly returned to packet radio so the routing/addressing
problems are new to me. I have, however, spent 7 years working on
standards definitions (EDIF, VHDL and a couple of others) so I feel I
have some insight to add here.

In article <10028@platypus.uofs.uofs.edu> bill@vulture.cs.uofs.edu (Bill
Gunshannon) writes:
}In article <20021@helios.TAMU.EDU>, willis@cs.tamu.edu (Willis Marti) writes:
}|> (1) Drop/change the continent specifier. As you are proud of pointing out,
}|> the country codes you use are from an ISO standard. But, as you sometimes
}|> admit, you picked/made up the continent codes all on your own. The new
}|> list you just posted will, I think, cause even more conflicts.
}|> (2) Change the character separator, ".", to something like ";" -- or
}|> whatever. The '#' was added for parsing ease; why not change the period?
}Actually, (1) is all that is necessary. This is not a routing problem. It has
}nothing to do with gateways between PACKET <-> INTERNET. It is simply
}a problem of having non-unique top level domain. Unless I am unusually
}blind this morning, it appears to me that merely changing the 2 letter continent
}designators to some 4 letter code would solve the whole problem AND make
}routing/gatewaying easier by making the last part of the domain easier to
}differentiate.

I urge EXTREME caution in making ANY changes here! It is simply amazing
the ramifications of seemingly simple changes in a widely used format!

You are quite correct in using the ISO/ANSI standards wherever they
exist, not because they are standards or "approved", but because the
process of approval applies enough tests and trial to weed out the
traps. "Rolling your own" in something like this is a sure way to
disaster, even professional standards makers go through an incredibly
extensive review process to weed out the "gotchas". Often very subtle
ones like the zip code/district conflict that has been pointed out
already.

It seems to me that it is very desirable to minimize the translation
required to go from one network to another as much as possible. Not just
to reduce the size of the code required, but to minimize the chance for
screwups like the "NA" designator.

The advantage of the "Internet" addressing scheme is that it has been

tried and tested for many years in many many situations and has been shown to work well. As a result it is VERY difficult to get people to agree to change it. It would seem reasonable to emulate that scheme as much as possible in the amateur network.

Ok how about some specifics.

First, I agree with the sentiment that questions the need for the continent identifier. It is reasonable to assume that the volume of traffic will correspond to the amateur population in an area. Therefor one would expect the traffic volume to be ordered something like this:

1) One's own country - "national" traffic
2) Japan
3) USA
4) UK
5) Germany
6) Canada
7) Australia

I am taking guesses at the relative populations here, but my point is that the traffic volume is HEAVILY ordered by country making a low overhead lookup very simple. I would suspect that for any one station the first 5 entries would handle 99% of the traffic and very likely handle everything that COULD be handled by that particular station.

The 130/250 country list would only have to be used in very rare situations. It is not unreasonable to expect some special handling for a message to say Pitcairn Island.

All in all it would seem to be an extension of the problem within the U.S. in which 50 state designators must be searched with radically different routings for each state. I suspect that even a European routing for Hawaii and Maine would be different.

Any comments? Am I simply stating the obvious or am I all wet?

}Carrying it one step further, you could even apply to ISO for official recognition
}of the 4 letter continent designators you choose. Thus making it official.

If you/we come up with a truly FOOLPROOF scheme then this will likely happen very easily. The hard part is to find a foolproof scheme.

Interesting thread. Most interesting to see the same arguments that
have been going on for the better part of a decade (yes, decade) with
still no resolution.

I think that Phil Karn made a significant point back when there were
two camps arguing about X.25/ISO vs. IP. Phil went off and wrote his
KA9Q package and a number of us played with it. Gordon Beattie (sorry
if I have misspelled your name Gordon) was the driving force behind
ROSE so it got done and people are using it now. The key here is
DOING not ARGUING.

Now as for which is best? I personally believe that the amateurs have
managed to mangle most of it (IP, BBS, NetROM, ROSE, etc.). It is
amazing that any of it works so I would not be holding ANY of it up as
being "the way to do things."

So, don't argue; prove your point. Implement something, instrument
it, and then document the results. This eliminates the arguments and

is far more productive.

In the mean time I will go back to constructing fast, flexible,
inexpensive networks that move mail, files, and terminal QSOs -- using
the telephone system. With luck the FCC will allocate spectrum for
building commercial high-speed, reliable packet radio networks and I
can then include packet radio as part of my network.

Very useful attitude! Does the FCC think so too?

Of course the BBSnet is at fault. You people were told that this
braindamaged adressing scheme was going to cause problems and you
people adopted basically the same attitude (`We don't care').

You _really_ do not understand the problem. The networks and their
gateways are working 100%.

When an ordinary user (not an expert, just an ordinary user) sees
in a signature "My packet address is user@some.where.in.NA), that user
simply mails to that very address, and expects the mailer to know
how to get to some.where.in.NA. Now of course the mailer knows how
to do this, it sends the mail to Namibia, exactly as instructed.

Please think carefully now - where else can the mailer deliver
.NA mail to except to Namibia? That is where the mail gateways
will deliver it.

The problem is that the ordinary user is misled into thinking that
he simply uses what looks like an ordinary FQDN address. Not a
gateway problem, not a munging problem, but a problem created by
a packet radio type saying "My address is in Namibia". What he
means to say is "My address is in North America".

How much more simply must this problem be explained?

My word, no wonder it is a problem.

Mike

In fact, Digital DECnet user who has HOST::USERNAME form of DECnet Phase IV
address, can be addressed from Internet as USERNAME@HOST.enet.dec.com. (Please
refer to gatekeeper.dec.com:~ftp/gateway.doc for details) I thought this sort
of scheme could be applied on RLI/MSYS, such as
user-callsign@host-callsign.another.fake.domain.

]I agree with your point, but then how SHOULD I send mail which
]originates here (waters@nddsun.sps.mot.com) to my amateur radio packet
]address - aa4mw@k7buc.phx.az.usa.na - ?

I think you can't map two different naming systems on a same naming space. You
should compromise to add some "fake" identifiers.

I have suggested here on rec.radio.amateur.packet to make a "fake" domain for
Internet addressing. (Such as ".fwdnet" or ".pbbs.ampr.org" (Maybe Brian
Cantor will say something different, but I foresee no problems on mapping
RLI/MSYS naming scheme into ampr.org as a fake subdomain.)) I think the same
kind of thing can be applied on the RLI/MSYS side.

]It seems that we must first all agree on some scheme that works both
]ways before anyone can even dream of implementing it in a BBS!

Exactly.

No this is not at all the case. It happens only because someone put
something like xxx.xxx.USA.NA into his signature and someone else uses
this to answer him. It has nothing at all to do with any gateways
(which may not even exist).

regards, el

If the problem is that mail to user@anything.NA physically goes to
Namibia before being bounced, isn't there a solution involving having
domain name servers that are better connected that handle the NA domain
and know about the proper subdomains there? I just checked how mail I
send would go to lisse.na, and I find MX records at m2xenix.psg.com
and rain.psg.com. Looking at the latter, I see MX entries for the
default names that address an apparently bogus host named
"no.such.host.in.namibia.na". It looks like it is supposed to bounce
mail to bogus NA addresses without it going there.

Dr. Lisse, I would suggest sending mail to postmaster@rain.psg.com if
this isn't working, and to the postmasters at the other domain name
servers that provide your routing if it works, but is only installed
over there. From these discussions, it seems like you need a solution
much earlier than any change is going to occur in the amateur packet

systems.

Can you say that with 100% accuracy? I posted, correcting myself. See that message. But it remains: BBSNet canNOT be held responsible for someone who uses an address wrongly. The individual user is to blame. If he uses my telephone number or address and it goes astray, should I have my postal system change? Granted, some folks post their packet address in their .sig and this may lure the unwary astray. User education, again, NOT that a whole network should be taken out and shot.

Unfortunately, true. However, I'd bet you a six-pack that mail goes astray all over the Internet all the time because of a bad address. This happens to be a rather glaring case.

|> Please think carefully now - where else can the mailer deliver

Is the "packet radio type" saying that his INTERNET address is "My address is in Nambia" or his PACKET RADIO address looks like an Internet address in Nambia? If the former, correct him. If the latter, sigh and reflect on the ignorance of mankind, then proceed to educate the sender of the message. Ours is not a perfect system. I understand the "symptoms" of the problem have been abated. I'm glad for that.

|> How much more simply must this problem be explained?

Indeed.

Hi, I'm not sure if this is the right newsgroup, but....

I am using an mbuf struct (file mbuf.c in net package), and
I am rewriting the contents of a TCP packet's body, and hence
must resize the thing by doing something like:

```
oldlen = len_p(bp);
newlen = strlen(newdata);
difference = newlen - oldlen;

if (difference > 0)
        bp=pushdown(bp,difference);
else
        pullup(&bp,dum,oldlen-newlen);
memcpy(bp->data,newdata,newlen);
```

Say the original mbuf length was longer than the new one, this resulted in a
pullup so that the new mbuf is the correct length and the packet is sent as
desired; however, not the next packet, but the subsequent packet after that
contains the "chopped off" stuff tacked onto the beginning of the data field ...
I can't seem to be able to get rid of this extra segment period.. I've also
tried a call to trim_mbuf(), but the same thing happens.

Does anyone know what I should do?

thanks in advance,
cheers,
tony

There is no need to shoot the network. However, BBSNet *CAN* be held
responsible for using an address format that can be misinterpreted --
especially when people have been telling them over and over that the
misinterpretation WILL occur, and especially where there are real
synonyms for the names (e.g. if Continent designators are used). If the
Post Office tried to assign addresses of the form: (415) 555-1212, I think
we would be justified in complaining that the address FORMAT was not
unambiguous enough to prevent people from using the address in an incorrect
context (i.e. as a phone number).

>of the problem have been abated. I'm glad for that.

If I tell you to contact me at (415)555-1212, I think you are justified in
thinking this is a phone number, for use on the telephone network, and not
an address for use with paper mail. If I tell you to contact me at
wb6ece@wb6ece.something.NA it is not intrinsicly obvious that this is a
BBSNet address rather than an Internet address.

The problem with the ham radio BBSNet folks (and I mean specifically the ones
who set the standards for the routing designators) is that they just don't
give a damn about how their actions may affect non-hams. As long as the
address format works on BBSNet, to hell with any ambiguities and problems
it may cause on Internet, or JANET, or BitNet, or FidoNet...

Until these folks grow up and adopt a world view, ham radio BBS operations will continue to be looked down upon by others not in the hobby. I hope you noticed Dr. Lisse's comment re: the FCC. It is not inconceivable, in my mind, that the FCC would mandate a non-conflicting address format if it got enough complaints from other countries.

I would suggest the obvious solution is scanning routing hints right
to left. Posting software should always require a full hierarchial
address. It may supply default continent and country, even state and
local, designators if none are supplied by the user. Then by scanning
right to left all ambiguities caused by local names are resolved properly
at the appropriate local level. Your forwarding software should certainly
have a forwarding solution for continental designators that it can
fall back on if a forwarding solution fails for countries. Similarly,
if a country solution is found, it can be fallen back on if a state
solution is missing. And so on down to local LAN names. There is
never any uncertainty because *every* address would start with the
same top level field as it's rightmost element and the software scans
until it can resolve no further. There should never be confusion between
a country code and a continent code, or some very localized code as
scanning descends the routing hierarchy. The only precaution needed to
prevent problems with other networks is to avoid using conflicting top
level names. In the case of the BBSNET, there are only seven to worry about.
The major fault of current BBS software, as I see it, is that it doesn't
respect it's own self imposed hierarchial nature, because it scans in the
wrong direction.

OK, I'll go that far. BBSNet can be held responsible for usng an address
format that can be misinterpreted. But the fool that uses the address
wrongly should be held responsible for causing the grief! You don't blame
the tool, you blame the guy holding it!

     Please provide names as to who told whom about these problems. I have
yet to see any documentation on this part.

     As to the Post Office part, remember that the Post Office governs the
communications in other countries, 8-}, so they could have very well done so.

|> wb6ece@wb6ece.something.NA it is not intrinsicly obvious that this is a
|> BBSNet address rather than an Internet address.

It is to me, since I have a few brain cells to recognize the address. Now if you are expecting the whole world to have the power of a TRS-80, you should tell me Packet Radio: wb6ece@ wb6ece.something.NA, thus effecting a soluton to the problem.

|> The problem with the ham radio BBSNet folks (and I mean specifically the ones

|> it may cause on Internet, or JANET, or BitNet, or FidoNet...

Since we, by FCC rules are not SUPPOSED to be directly interconnected, it wasn't supposed to happen anyway. Third-party traffic, remember? BBSNet addresses will work well if one goes through a gateway, using proper address Hell, yes, BBSNet addresses may go astray and cause problems. But use them properly and it works.

|> Until these folks grow up and adopt a world view, ham radio BBS operations

|> enough complaints from other countries.

Pardon me? We've been transferring messages all over the world for some time without the Internet, thank you. I'd take that as a world view. I'm sure that SNA bigots consider the Internet as below their notice. This whole thing boils down to the fact that:

A. BBSNet address formats are similar enough to cause problems if used on the Internet.

B. Some Internet folk think that since this is a problem, the others must change to conform.

Sounds very much like certain political viewpoints to me.... It'd be quite illuminating to take a poll as regards gun control.

As far as the FCC is concerned, I rather think they'd laugh in your face. The problem is not related to anything in which they have jurisdiction. The problem lies in incorrect operation not in their province.

|> Hank: are you listening?

I'm sure he is.

>   Several people have pointed out that this only happens with MBL software.
>They're probably right: my local BBS is an MBL system (whose sysop hasn't

The latest release of MBL, 5.14 is now several years old and doesn't
support heirarchical addressing very well. (In fact all it does is pass the
addresses thru, it doesn't actually use them at all. :-( ) MBL was
actually quite nice, it's a pity Jeff didn't continue with it.

>somebody gets a bright idea for his/her BBS program, doesn't think it through,
>(and ABOVE ALL doesn't discuss it with some of the other BBS authors), then
>we get stuck with the results for a couple of years till it all blows away.
>Surely we can do better than this? We are, after all, supposed to be in the
>communications business.

Even with communication there are problems, remember the header lines
argument and the heirarchical debate. We ended up with different authors
going different ways AND they were talking (well, yelling actually) at each
other. :-(

>   Currently the problem is that packet radio addresses look like Internet
>addresses, and I wouldn't blame some poor sod who didn't know the difference

>I think I'd agree with the poster who suggested that changing the separator
>from '.' to something else would be a good start.

It's a good idea, however there is a tremendous amount of inertia in the

packet BBS community. If we did decide to change the separator then we'd end up with two different ways of specifying an address. Just look at all the people still running early versions of BBS code, some even that don't support heriarchical addressing and so on. I doubt whether we could convert most sysops at all. Remember, most Amateurs are totally ignorant of other networks and so are very parochial and, often, antagonistic when confronted with change. (example, the CW debate)

What the above waffle means is that I don't think changing the separator is practical.

Perhaps what gateways should be doing is appending .ampr.org on everything originating from the packet network?

Gentlemen,

I , as a very minor bbs software author have had huge problems in the past getting info about what is really going on in the pbbs world.

I see W0RLI, AA4RE and VE3GYQ ,to name three, on here and presenting more verbage than I've ever seen from them.

How about, if not a rec.radio.amateur.pbbs, at least a mailing list

for pbbs stuff? I know about several others like me who have their
own pbbs software (because they wanted to do something that the
RLI/4RE/MBL stuff wasn't designed for, like run in a unix environment)
who would greatly benefit from knowing what the latest "whiz-bang" feature
is that's going to make us incompatible with the pbbs network *this*
week 8-) .

I guess we have to do more educating, like some suggest. One facet
of education is information, and there has been almost no flow of
same regarding the pbbs net. It seems that a lot of the present
confusion and flame-throwing were initially caused by lack of
education/information among internet folks who weren't aware that
packet radio addresses were different and should not be used on
internet !

To perhaps better summarize:
1. There is no flow of information pbbsnet->internet.
2. There is no flow of information internet->pbbsnet.
3. There is no flow of information concerning pbbs software design.

Can we fix this?

John,

You won't be violating any copyrights unless you try to SELL the ported code AND/OR you are going to use it for purposes other than Amateur Radio or within an educational establishment (i.e. a colleg - internal corporate training departments don't count :-)). In a nutshell, the code may not be used within a commercial environment, UNLESS it is for your personal Amateur Radio pursuits.

This copyright information is imbedded within the source code modules, which were written by a number of different people, the most noteworthy being Phil Karn, KA9Q himself.

Oh boy!

Your posting touches on many of the frequently asked questions that are asked about our hobby, including packet radio.

Rather than answer them here (and have everyone followup, debate, flame, counterflame) perhaps some assigned reading would be in order.

There is an excellent set of informational documents prepared that are available via anonymous FTP (ftp.cs.buffalo.edu under /pub/ham-radio).

They include:

1. A list of general amateur radio frequently asked questions with consensus answers written by Diana Syriac, KC1SP.

2. A similar list specifically dealing with packet radio written by Steve Schallehn, KB0AGD.

3. A list of mentors (called "Elmers") to refer to for specific questions via E-mail written by me.

To answer your question about whether you can use packet radio to connect to your University computer, well, yes and no.

The amateur radio service is allocated by the FCC for individual experimenters with specific prohibitions against furthering business of any party (directly or indirectly, profit or non-profit) and against non-licensed individuals initiating communications via amateur radio allocations.

If you have any more specific questions not answered by the above, please don't hesitate to write me E-mail.

Good luck!

Thanks Brian for the private reply re RFCs etc. Of course I recognize
that they have become standards and I was really not trying to argue the
point - but they are standards on the INTERNET. They seem to have stood the
test of time in many cases, and that does give one cause to consider adopting
them elsewhere - but it cannot be considered mandatory.

It strikes me that the problem has come up because:
someone used a gateway that does not provide proper encapsulation, or
someone posted someone else's message from the bbs network onto the
INTERNET without indicating such...

I agree, that would seem to be where the problem lies ... the other
point that folks seem to be ignoring is that by and large, the BBS network
IS NOT INTERESTED in using the INTERNET to pass messages. That having been
said, I think folks have to understand why the BBS sysops feel frustrated
at listening to this debate.

Yes, an attempt will be made to help out ... but I think the gateways will
have to help as well.

And to the person who said that the continent codes were "made up", I
DON'T THINK SO !!!

Wow, what a monster thread ... since I get this via the digest, the thread
appears to be a little disjointed with respect to response time.

References: to numerous to mention.

Instead of trying to assign blame or point fingers, lets solve
the problem. What is done is done. As pointed out by several

people, the sheer inertia of the current AX25 BBS system precludes any solution involving a radical change in address format.

Here's my ideas:

1) Internet users who refer to their BBS addresses in signature blocks should make it plain that these are AX25 packet BBS addresses and not Internet addresses.

2) Gateways that bridge AX25 packet BBS messages into the internet should alter the contents so that any return address is clearly marked as not being for Internet.

I think we can all agree on this?????

Finally, we amateurs must answer the question:

> Do we want the TCP/IP network and the packet AX25 BBS network to be able to interoperate?

If not, you can disregard most of the rest of this message.

If so, should we plan on merging the TCP/IP domain naming convention with the AX25 packet BBS address scheme? I like the idea of a top-level domain name / hierarchical address word that indicates the rest of the information is the AX25 BBS address. Several people have mentioned this previously but we continue to yell at each other rather than trying to solve the problem. I will again reiterate my suggestion of things like:

> aa4re.#nocal.ca.usa.na.ax25bbs

This change will be transparent to most AX25 BBS programs. Unfortunately, my BBS does not do the left to right parsing but does worry about the whole name. Luckily, one pass over the control files will fix that.

Addresses that are used on the internet will go to a non-existent domain or maybe someone will use them as gateway indicators.

Amateur radio TCP/IPers could also use the high level domain name to indicate that the message must go to an AX25 BBS system for delivery. This might even relieve the necessity of coding every amateur call into control files to indicate SMTP versus AX25 BBS destination?

Am I all wet with this or does it make sense. I am learning a lot about TCP/IP these days and am not an expert but it looks right to me. Can we confine the discussion on this to technical issues rather than political/religious flaming?

Roy, AA4RE

A test version of my BBS program entitled 2.1Q is now available via
FTP from W3IWI's tomcat system. This is a test version and it has
bugs.

Significant new features:
  -- shared overlay file manager (no more busy messages)
  -- new full screen review command to allow easy monitoring
     of messages
  -- direct interface to G8BPQ node V4.03. Eliminates need for
     DEDHOST code.

Files are
  BB21Q.ZIP -- Everything
  BB21QU.ZIP -- All files updated since BB2.11 (the current released
                version).

I've been watching this one on and off, and seeing as how this nonsense is
*** STILL *** going on, I have to ask a few questions....

then, I'm going to ask/suggest something that may very well help (and it may
not).

none of this is meant as a flame --- please do not interpret it as such.

In article <1991Aug7.173525.27550@apd.mentorg.com> hank_oredson@mentorg.com
writes:

> Well Marc, we (the bbs authors) await your suggestions.
> What is it we should do? How should we do that?

as has already been said at least a hundred-thousand times, follow the
accepted standards. the argument that it doesn't work is false. I can
see why this screwup might have happened in the first place --- the bbs
software was written in a vacuum. at the time, perhaps this was considered
ok, since it was intended to be used that way as well. now, however,
that assessment is turning out to be wrong. fine. you know what they
say, do it right the first time....or you have to spend twice as much time
fixing it later. guess what.......

> While doing that (whatever it is) keep in mind that we
> wish to support only a small number of users (about 100,000)
> with only a small number of servers (about 10,000), and that
> those users will often have *NO* local processing capability.

first, WHO CARES if the users themselves have '*NO* local processing
capability' --- granted, right now, I'm using a pc to pretend that it's a
dumb terminal...but it basically has no say in the operations of the UNIX
machine I'm working from. does that prevent me from sending e-mail and
posting articles? no. it has nothing to do with it.

my dumb pc keeps sending bits to a far-away land. it knows nothing of what
will happen to those bits, nor does it care.

now, as far as BBSs not having the smarts to do global routing....WHO CARES?
my UNIX machine here (well, there.... :-)) knows nothing about routing mail
beyond Amoco computers. in fact, it sometimes has problems with that (or
did, at least). it doesn't matter. when my machine has mail to send that
it doesn't know how to handle, does it just go off into a corner and sulk?

no. it passes it along to another machine who has more mail routing
information...like how to access non-Amoco machines.

after my machine sends the mail on to its server machine, that machine will
then look at where the mail is headed, and if it leaves Amoco, it will pass
it along to our Internet mail gateway, which....... you get the idea.

so even the local BBSs don't have to know how to route to everywhere in the
world. all they need to know is where to send it if they don't know what
else to do with it.

> So post some useful ideas please, since it sounds like you
> know what the solutions are.

ok. here's my final question, which can also be taken as a suggestion.
if I want to send mail, for example, to friends back in Aggieland on a
machine that is on BITNET from Internet, I would address it to
joe_user@tamvenus.bitnet --- notice the .bitnet? (yeah, I know....VENUS
is also on the Internet...but it's habit now.)

so, why can't we simply register something like '.packet' with the NIC,
and put all this nonsense to bed? then, make sure people know that if
they want to mis-use .NA and call it North America, they must also use
the .packet to let the system know it is for a foreign network. now, I
must admit that mail is not my strongest area --- sendmail.cf still scares
the sh_t out of me, but it seems obvious that this is a solution to this,
and will help in any attempts to interconnect the lot.

my packet address might then look like n5ial@wb9yae.chi.il.packet or
something like that. the gateway machines (if there are any) could
then say ``hmmmm....he's a .packet, and is in ill. --- he must therefore
be in .usa.na.earth.western_spiral_arm.milky_way.universe'' or whatever
it wants. who cares --- from that point, it would be leaving the Internet
machines alone. but while on the Internet, it would conform to standards.
the gateway machine has the smarts.

likewise, if I sent mail (mind you, this all assumes that such a gateway
exists) from packet to an Internet address in Nambia,.....

while on packet:
>From: n5ial@wb9yae.chi.il.usa.na.earth.western_spiral_arm.milky_way.universe
>To: user@machine.na.arpa

once on the Internet:
>From: n5ial@wb9yae.chi.il.packet
>To: user@machine.na

so what's the problem?

oh, people would have to be sure that their .signature clearly points out
that their address is in .packet.

   --jim

Standard disclaimer....These thoughts are mine, not my employer's.

Some folks use .NOAM instead of .NA as the continent designator. Why not
switch to .NOAM? No sense in reinventing the wheel here. You can even
register that with the NIC if they'll let you. This will solve one part of
the problem. Educating the user population about the differences between
PBBS addresses and Internet addresses is something else :-)

As a gateway operator, I've taken steps to intercept addresses of the form
*.<ISO country code>.NA so that they are forced to the PBBS world instead of
the Internet. Unfortunately, this means an additional 46 lines in the NOS
rewrite file. Those 46 extra lines take all the wind out of a basic tenet
behind hierarchal addressing - simplification of routing. The sooner we
get away from .NA, the better.

For those of you who are still debating the merits of using the Internet to
route PBBS mail, be advised that isn't the only reason the gateways exist. The
gateways also provide mail paths between Internet hams and packet hams. They
provide access to Usenet news for Hams on packet. They provide packet access
to the callsign servers. The gateway operators wouldn't have set these systems
up if there wasn't a desire or perceived need for them. The gateways haven't
been around for very long but they will continue to exist and grow in number.

It is a general nature of networks (PBBS and Internet included of course) to
grow and become interconnected with other networks. That is the reality we

must deal with now. Finger-pointing isn't going to help us deal with that
reality...

>>>-Jim Durham (durham@w2xo.pgh.pa.us) or packet-wise: W2XO@W2XO.PA.USA.NA

The official international internet domain for packet radio is AMPR.ORG and
I am its administrator. There are some regional packet radio internet
domains, such as the one in Japan.

These are the hostnames that may appear on the internet.

Internally within the packet radio network, a crude and primitive
stopgap geographical hierarchical routing scheme evolved that used
addresses such as the one in question above. Those addresses are really
routing instructions and should never appear in internet mail or news
headers. That they appear in someone's signature block is insignificant.

There are only three country identifiers which appear within the .NA
continental identifier: USA, CA, MX.

If packet hierarchical addresses are to appear in the internet context,
they should be enclosed within the AMPR.ORG domain, e.g.,
     W2XO@W2XO.PA.USA.NA.AMPR.ORG
but this is strictly a kludge for compatability.

Assuming that Namibia does not use the second-level domains of USA, CA,
or MX, Uunet could install three CNAME records in its nameserver to
rename CA.NA, MX.NA, and USA.NA to CA.NA.AMPR.ORG, etc. This would
properly cause misaddressed mail to be flushed down the toilet at the
earliest opportunity, thus eliminating transport charges to Namibia.
Likewise, if the Namibian mail gateway were to install a similar
"firewall", transport charges from Namibia could be eliminated.

Meanwhile, perhaps the ham radio community can band together and admit
its mistake in making hierarchical routing addresses look like internet
domains. It could be solved simply by choosing a different separator
character - the + sign or colon, for example - but unless something is
done this problem is only going to become worse and not better.

I spend most of the weekend trying to set up tcp-ip on my toshiba
laptop and the pk232. I am having a terrible time at it. I am using

the 6/91 version of net.exe (NOS). So far I can sometimes do a ping
successfully, but mostly I seem to get checksum errors. (visible by
trace)

Does anybody out there use the pk232 for tcp-ip? What do I need to do
to get to kiss mode if I use PC-pakratt for normal packet?

I would really appreciate some help or advice. The documention out
there is either very confusing or is out of date. Took me half a day
to figure out the hosts.net is no longer used!!

Thanks,
Tom

For the folks hearing about this in rec.radio.amateur.packet for the first
time: Apparently folks are trying to use packet BBS addresses when sending
mail from the Internet, perhaps in the (mistaken) belief that there is a
gateway from one to the other.

.NA, in the Internet world, is a top-level domain for the country of
Namibia.

In article <lyndon.680725827@aupair.cs.athabascau.ca> lyndon@cs.athabascau.ca

Don't complain about a working system unless you're prepared to implement
an alternative. The hierarchical naming convention works well. It's the
users who need to be fixed...in this case, educated that sending mail to
a BBS address in North America from an Internet node will instead result
in that mail getting sent to Namibia, and, most likely, bounced there.

Another (possibly simple) answer, at least in the Phoenix area DeVry
Institute Ham Club gives tests every month. A call to them might prove
worthwhile in your area too!

If you hear about any "hamfests" then there is almost always a testing
session there too. THe Scottsdale hamfest (Oct 11,12,13 this year) plans
a three day COURSE ending with the test!

At Ft. Tuthill last weekend (S. of Flagstaff AZ) there were 600 tests
given! (Somewhat fewer people since some people took mutiple tests). It

is best to pre-register if you can (phone the VEC) just to be sure there is space, the VEs at Tuthill were overwhelmed with the numbers (5 pre-registered), but as far as I am aware no one was turned away although some people had to wait several hours for their test.

    One word.
    Suicide.
    In order to fully appreciate all the capabilities of net it would be nice to have it incorporated in the kernel, but it's not. I knew of someone who was doing such a thing, but I haven't heard from him in ages.
    Minix is not a system I would recommend trying net on. I run Minix at home and personally don't think it's worth it. Someday Minix will have REAL TCP/IP, and then someone can make an AX.25 driver and we'll all be happy.
    In the meantime, MS/DOS works just fine.

I just realized that the file ka9qnos.ps file on 128.54.16.1 is
corrupted and only has the first 18 pages of the manual. It would
help us greenhorns a lot if all old out of date manuals and maybe even
old versions of the net software would be removed from /pub directories on
the net. That way I would not be mixing apples and oranges.

Tom

Don't point a finger at WA8BXN (the MSYS author) for this. It was invented long before MSYS appeared. The original paper was authored by W0RLI, VE3GYQ, and W3IWI.

Why, when deficiencies in software are unearthed, is there a push to educate users rather than fixing the bloody software? This isn't the first instance of this: the obvious one which comes to mind is the need to add the '$' when you want to send a bulletin to a whole group of BBSs rather than just the one you're logged on to.

In case you missed it, if you enter 'sb rhubarb@xxx', your bulletin goes to the Great Bit Bucket In The Sky (at least it does on an MBL system: I assume the others are no better). You have to enter 'sb rhubarb@xxx $' if you expect it to leave your own BBS.

Another case in point was the propensity of the original hierarchical addressing software to scan from left to right: a procedure which meant, for example, that 'WA' (for Western Australia) couldn't be used due to probable confusion with Washington State. Rather than modify the software, the solution

proposed was to use 'WA' for Washington, and '#WA' for Western Australia.
   Both of these were elevated to the 'it's not a bug: it's a feature' category and became almost impossible to change.
   Why not just change the software and make it easier on everybody?

.....Ron

Hey, maybe I am naive or something about internet and packet (which is a real possibility), but as I understand it, any gateway between amateur radio packet networks and internet would have to be watched very carefully at the gateway site by the CONTROL OPERATOR. This would be absolutely necessary at the internet to packet side in order to avoid any possible problems like the 900 bulletin problem (we all know abt that by now, nuff sed). Allowing such gateways would in turn allow non-hams to get on the ham packet network, amounting to third party traffic, which would require the transmission of the info by a licensed ham who is the CONTROL OPERATOR.

Anyway, my point is, there really should be no problem with overlap of amateur packet and the internet addresses as hams operating should see these problems before they occur. I know that the idea of gateway ops checking each message going thru will not be popular (understatement is one of my fortes). I believe that this is necessary, though, from a legal standpoint (I realize that this last remark will invoke the rath of many legal minded folks and will accept the heat). My remarks abt legal matters are from an individual standpoint and not meant to reflect the true legal status of such questions.

I am not sure that these gateways are such a good idea anyway. (Yet another remark worth buying an asbestos suit over) The Amateur packet network system and the internet network are designed for two different uses and perhaps

an intertie between them would be detrimental to them both.

Ok, the above remarks are INTENDED to spark some tempers, but not to cast them into some great bonfire. I meant no malice, just trying to get the real dope on the subject. Bring onthe heat, baby

Not necessarily. I am one of about a dozen Packet-Internet gateway operators and I have not had any trouble whatsoever yet.

Because the gateways use ip encapsulation to hide the amateur packets in Internet packets, this forms a fairly good brickwall stopping:

+ amateurs accessing the resources of the Internet (apart from using the Internet to connect to the other packet gateways)
+ Internet users sending packets past the gateways because:
    - nobody on the Internet knows how to route to 44.x.x.x, and
    - even if they could, the packeteers can't talk back

> Allowing such gateways
> would in turn allow non-hams to get on the ham packet network, amounting to

> licensed ham who is the CONTROL OPERATOR.

At the moment, this is really only possible if a gateway is itself involved
in active mail handling. Turning mail handling of gateways, and using them
only to route packets closes that hole totally.

> I am not sure that these gateways are such a good idea anyway.
> The Amateur packet network system and the internet network are designed
> for two different uses and perhaps an intertie between them would be
> detrimental to them both.

Not for international chats and mail forwarding. Our gateway here in Australia
allows us to send/receive mail to/from the US, Hawaii and Europe. And
using axip, we can even digipeat to these places as well. With enough
gateways, we can use the Internet as a `backbone' network to speed mail
and bulletins to their destinations.

> Ok, the above remarks are INTENDED to spark some tempers.
> I meant no malice, just trying to get the real dope on
> the subject.

That's ok, there are a few of us out here patient enough to explain things!

A brief explanation on ip and ax25 encapsulation, to show how it works.
Imagine two (or more) gateways on the Internet who want to pass amateur
IP packets over the Internet. This is currently impossible, as no
routes exist for 44.x.x.x packets.

The solution is to use a 44.x.x.x address for the gateway's amateur
interface (TNC etc), and a `real' Internet address for the gateway's
Internet interface (Ethernet etc.), and to _encapsulate_ incoming amateur ip
packets in `real' internet packets. For example, imagine the gateway gets
the packet

     IP: 44.136.0.25 -> 44.62.0.1 Data: blah blah

The gateway prepends another IP header to the packet, determines the
appropriate destination gateway real Internet address, and sends it:

IP: 131.236.20.90 -> 192.100.76.2 IP: 44.136.0.25 -> 44.62.0.1 Data: blah blah

The destination gateway receives the packet, unwraps it, and passes it along.
This provides a pretty good brickwall, as amateurs cannot route to the Internet
as their packets are encapsulated, and Internet users cannot route to 44.x.x.x
because none of the Internet machines know how to.

Next question, please!!!

Your assumption is false. My software, and a lot of other software, does not
require the $.

I love the way you say `just'. You must bear in mind that all packet BBS
software (at least as far as I am aware) is written and distributed by
people who spend a great deal of time and money in producing something which
is then given away free of charge. Changes are made if it is found that
something doesn't work as well as it was originally thought, but those

changes do take time, because they have to be fitted in to whatever little spare time is available to the software writers. Any changes which require co-ordination between the various software writers take longer because there are quite a few of them spread around the world (I can think of 4 in the USA, 3 in the UK, 1 in France and 1 in Germany off the top of my head). Changing something as fundamental as the heirarchical addressing scheme is going to be very difficult, because both the old and the new scheme would have to be run in parallel until everyone was capable of supporting the new one.

Don't assume that we aren't doing our best to improve the system. You ask any packet BBS software writer, and they will show you a list of requested changes as long as your arm. It might take us a while, but we will get there as soon as we can.

The Packet<->Internet gateway here is getting a lot of use, of which I'm glad. However, there are some problems...

Problem #1: People mailing on *internet/usenet* to my *packet* address (W2XO.#WPA.PA.USA.NA). This causes mail to be sent to a nameserver in Namibia, in Africa! Please don't do this! Packet is a separate service with different addressing conventions. The correct way to mail to the gateway is "bbs@w2xo.pgh.pa.us", which is a valid internet address. 8-) . Unfortunately, US domain internet addresses and packet "hierarchial" addresses look very similar at first glance. The packet address is not domain-style at all, it's geographical source routing. Yeah..I know..it's crude, rude and gross, but I can't change the packet dudes. I've tried 8-(. Fortunately, the packet token ".NA." is being changed by a lot of folks to ".NOAM.", as there is a ".NA." being used by the Australian bbses for "North Australia", I believe, and some of the bbs parsers are not done correctly so this can be overriden by ".AUS." .

Problem#2: Mail sent to the correct address but with incorrect
formatting. Mail sent to the gateway must start with a packet
"send" command line as the first line of the text, and end with
a "/EX" in the first column of the very last line (After text
and sig). *Please* don't e-mail to *me* at the "bbs" user name.
This causes grief, since the mail scanner doesn't know what it
is and bounces it. Please use "durham@w2xo.pgh.pa.us" to email
to *me*.

Problem #3: Slow delivery from internet to packet. Sorry..can't
be helped. FCC holds ham radio bbses responsible for *content*
of all mail passed on the packet network, as was amply demonstrated
by the recent fines/citations in the Norfolk case. I have to
read all the stuff that goes out on packet, and I'm not here
all the time, so....sometimes it's fast, sometimes not.

Thanks for your time..

Jim Durham (Internet: durham@w2xo.pgh.pa.us)

In article <lyndon.680828597@aupair.cs.athabascau.ca>, lyndon@cs.athabascau.ca
(Lyndon Nerenberg) writes:
:As I said before, the problem is not with gatewaying. The problem
:lies in the very poor choice of address syntax chosen by the AX.25
:BBS software authors.

I once heard that W0RLI (The author of the W0RLI systems) did NOT intend
to enhance his system in this way.

:However, how do you explain these sort of problems to the
:technically illiterate "appliance operator" that typifies amateur
:radio today? They have something that works for *them* so obviously
:the rest of the world is at fault and should change their ways.
:I like this about as much as you do, but the bottom line is it's
:an attitude that we are stuck with in the amateur community today.

True. You are correct. And that's why I feel strong resentment to "Amateur
Radio" itself right now. I personally do not want to forward ANY W0RLI/MSYS
messages to the Internet/USENET community, unless W0RLI/MSYS sysops COMPLETELY
UNDERSTAND the Internet/USENET naming schemes and INVENT their way to convert
names. FIDOnet have successfully done this.

BTW, one of PRUG members have written a conversion program between W0RLI/MSYS
messages and RFC1036 ones. He runs it on our network and works nicely.

:The result of this attitude will be a LOT of ill will from the
:Internet community at large when this group of appliance operators
:refuses to change their operating habits. And believe me, they
:WON'T change!

I know. PRUG members have tried many times to convince W0RLI/MSYS operators
in Japan in vain. :-<

:rikitake@jrd.dec.com (Kenji Rikitake) writes:
:>The PRUG has been using a domain name "prug.or.jp" and IP network number
:>133.168, since January 1990. I don't want USENET people to think that
:>ALL packet radio guys are ignoring the Internet policy and rules.

:And not all of us are. But we are a minority when compared to the
:total number of packet operators who have never heard of TCP/IP.
:(Or even worse, those who have and refuse to acknowledge that it
:might be of use, just because they don't understand it.)

Being a minority is not a problem. The main point is how to integrate
two different cultures of networks. And I do not want to change my
principles, just because lots of packet radio operators do not understand
what the Internet is.

BTW - PRUG do not forward any W0RLI/MSYS messages outside the prug.or.jp
domain.

> I assume the others are no better).

As far as I know, only the WA7MBL software requires this.

>   Another case in point was the propensity of the original hierarchical
> addressing software to scan from left to right: a procedure which meant, for

Solved in AA4RE V2.11 available for many months now. Wildcards in the
routing file look like this:

WA\.USA\.NA

This matches WA, WA.USA, and WA.USA.NA but not WA.AU. The "\"
(backslash) means that the string to the right is optional but must
match if present. The scan goes left to right so that anything before
the WA is ignored thus #NWA.WA will match correctly. If you want the
field in front of the WA to be useful, you have to code for it.

Note that the use .NOAM poses a problem now. We must either all
switch or not. I have had to circumvent this in my routing tables by
using WA\.USA\.N* (the N* matches anything starting with N) but you
can see the side effects of this.

I guess a problem like this had to crop up eventually, but I
think it exposes a larger underlying problem with the Packet Radio
BBS Network. I have been a BBS SysOp for a couple of years now and
have also been involved in writing a BBS Program (RTTYGate RTTY><Packet
Gateway). In that time I dont recall seeing any documents that set down
the standards for the operation of the BBS system.

I have seen several discussion documents (and would love to see
the one explaining the 4 letter continent designators) on mainly
the Hierarchial addressing but nothing on how BBS forwarding is
supposed to be conducted, how headers should be formulated and
only small amounts on White Pages and BID/MID's. All of these seemed
to be worded like DISSCUSSION doccuments, or passed on because
the majority of the existing software does whatever function a particular
way, and not really as standards.

Thinking about these things and also the current problem of the
NA ** LOCATION ** code on the BBS Network and *.na top level Internet
Domain, I started to wonder whether the Software writers and Packet
Operators should put together a set of Packet BBS "RFC like" documents,
called for example PBS's (Packet BBS Standards)? (if they dont already
exist, or if they do, make them much more widely known and formalised).

If such a set of standards existed, it would be a good starting place
for those wishing to write BBS software, and a good starting point to
modify existing code to produce a uniform network. Aspects that could be
formalised may include,

BBS Forwarding - Definition of Forwarding Dialogue
BBS Forwarding - BBS Header Standards
BBS Forwarding - Definition of Standard Compression Algorithm
BBS Addressing - Hierarchial Address Definition and Location Codes
BBS Addressing - Hierarchial Address - Parsing Procedure
BBS Addressing - Bulletin BID Definition, Message MID Definition
BBS Operation - Gatewaying
BBS Operation - White Pages

just to name a few!

It is pretty obvious that this will be a monster task, but then can
we afford not to do it? As the BBS net becomes more and more
connected to other networks, problems like the NA Address will no
doubt become more prevelent. Getting all BBS Software to conform
will take time as new versions will need to be written and the
Thousands of BBS's world wide upgrade to the new software but I
think it is a step that should be taken.

I would like to hear others thoughts on this. I am not volenteering
to write them, that should be a co-operative activity amongst ALL
BBS software writers but I do believe that if we dont move in
a similar direction to this that the Packet Network will run into
more and more problems in the future.

Cheers de Grant VK5ZWI

[I include some email between me and Mark MSW1633@RIGEL.TAMU.EDU because
  it may be of some use. Deepest apologies to Mark for breaking email
  confidentiality - Warren]

In email, Mark MSW1633@RIGEL.TAMU.EDU writes:
> .. non-hams have the same access to the information that we have, and there
> will always be hackers. Seeing who sent a message would be simple enough from
> the headers ...

Nope, believe me, it's fairly easy to forge mail and news, so we cannot use
these to authenticate messages.

However, if the gateways don't handle mail or news, then you have to find a

way of subverting the ip packet routing.

This is the difficult part (on both sides of the brick wall) because ip communication is a two-way thing, and the current situation is that the amateur ip boxes don't know how to route packets to internet boxes, and internet boxes don't know how to route to amateur boxes.

Therefore, even if you DO get a naughty packet or two through the gateway brickwall, the guys on the other side are not going to know how to talk back.

So, for a non-ham to obtain effective communications with hams (and thus transmit illegally), she would need a ham on the other side of the gateway to do devious things too.

> I guess what bothers me is the automatic action of the
> gateway, I don't totally trust software, cuz someone always finds a loophole

That's always true. Our ham rules here prevent a transmitter transmitting for more than 10 minutes continuously, but I've not found any hardware or know of any software in my TNC to prevent this from happening. If the Z80 in my TNC goes off into never-never land with the PTT down, I'll break the law. But I've yet to see anybody stop using a TNC due to this worry.

To wrap up then, you set up your system to be as secure as you can make it. You have to place some trust in the system, otherwise you might as well turn it off. And then you do a reasonable amount of monitoring to ensure that security isn't breached. And you react as fast as you can when it is breached. You can't do more than that.

Tom,
   It's possible that the baud rate between the computer and the
TNC is set too high for NOS to accept characters. This is due to
various factors including interrupt latency, lack of hardware
buffer, etc. If you haven't already done so, I recommend replacing
your UART chip with an NS16550AFN chip. This has a hardware
buffer (FIFO) which will improve things dramatically.

   Another possibility is that you are running short on memory.
Use the memory status command to check this.

>Thanks,
>Tom

I think this is a good idea. At present just about the only way you can
implement a new feature that someone else has come up with is to get a copy
of their software, run it, and try to work out the protocol (or whatever).
This is obviously far from ideal.

I think the problem stems from the fact that we started off with only one or
two BBS programs, and the authors of those programs managed to keep them
fairly compatible. However, there are now people all over the world writing
BBS software, and a lot of them don't know what is happening in other
countries. It also seems that everyone wants to change something just to
make their system stand out from the others (just look at all the different
headers).

As you say, it will probably be very difficult to come up with a set of
standards that everyone will agree to, but if we don't start doing it now
then it will soon become impossible.

It seems to me that all of this has already been done to a great
extent. See RFC 821, RFC 1036, RFC 976, X.500.

>It is pretty obvious that this will be a monster task, but then can
>we afford not to do it?

Why? IT HAS ALREADY BEEN DONE! The only problem is that now that we have
established MSYS type BBS' as the *standard*, we'll never be able to get
rid of the fucking things! (Sorry Mark, you can't gateway this one.)
But people are too "scared" of TCP/IP to use it. And this seems to me to
be the ultimate irony - in this age of "hi tech" appliance operators
who only live to buy rigs with more bells and whistles than the next

guy, they absolutely *refuse* to run a protocol with more bells and
whistles than the next one :-) Go figure ...

I'm posting the following for N9JR, please send any replies to me (WV9Z).

{ I need the C source code for the DRSI PC*Packet Adapter to query TNCTSR-S or
TNCTSR-L in host mode. My application is simple. I want to run PA0GRI/Bilow
code for NOS with some of my hacks, so I can run NOS and shell out and still
control the FT757GXII using some control program I have written, but I would
like to be able to add support for the DRSI so I can still have HF packet and
access to the local DX Packet Cluster on 220 MHz. This would be a simple
application to write if I had the C code to "talk to" the WA8DED host mode
under the DRSI tnctsr-s(-l). The DRSI folks have never responded to my letter
asking for the code which has been advertised as available under their manuals.

I was amazed to see the message from a poster on this group saying that a
$ had to be appended to bulletins before they would leave the originating
bbs.

Do people in the USA still use MBL ? I doubt there is one system left in
Europe using it for a number of reasons; the above being one of them.

All the software in general use (RLI,FBB,NNA,YFB,WSD) does not require
this $ to be added by the user. Perhaps those still operating MBL
systems should be encourages to change !!

On a similar note, I saw reference to the fact that 2 letter continent
designators were being changed to 4 letter ones. Nothing has percolated
across to this side of the Atlantic about this. If you want people to
change perhaps you should tell us !

Back to being an over-worked and under-paid sysop......

Well well ... the issue of addresses comes up yet again!

To the folks who say "fix the software" ...
Let us hear your suggestions. Fix it how? What should it do?

To the folks who say "fix the users" ...
Please send that article with the educational material to all
the packet BBS authors, we will be GLAD to send it out along
with our code.

To the folks who say "the system is not compatible with internet" ...
Yup, it's not. Should it be? Why?
What should be done to make it compatible?

To the folks who write gateway code and/or run gateways ...
Why does this problem exist?

Let's take a look at a packet BBS network address:

```
W7QRM@K7QSY.#DRAIN.OR.USA.NA
^     ^     ^      ^  ^   ^
|     |     |      |  |   |
|     |     |      |  |   +-- Continent designator
|     |     |      |  +------ Country designator
|     |     |      +--------- State, etc.
|     |     +---------------- Region within state
|     +---------------------- Server ID
+---------------------------- User Id
```

The user ID is unique, as it is a callsign.
The server ID is unique, same reason.

The first identifier is all that is actually required to address
any packet user. However, using it would require that every server
either know all user ID's and how to route to them, or have access
to a server which knew that information.

The second identifier helps to group users into groups that can be
addressed with less information (the server ID).

The other designators (#DRAIN.OR.USA.NA) do *NOT* form a network
address in the traditional sense. They are routing hints.
They look a lot like an internet address since they are dot delimited
fields. They look a lot like a location since they are constructed
from geographic designators. They are neither, but simply routing hints.

The packet BBS network is quite different from the internet.
User ID's are gauranteed to be unique. Server ID's are gauranteed
to be unique, with some exceptions we won't discuss here. Routings
are fluid (at the hourly level), not fixed. Users and servers come
and go, move from one sub-domain to another, change callsigns, etc.

The continent, country, state, and regional designators are drawn from
lists provided by the appropriate standard - typically the ISO standards
for naming regions.

Now what happens when one of these addresses passes from one domain
(the packet BBS network) to another network (say FIDONET)?
The address must be translated from one domain to the other.

What has been happening? People have used the packet BBS network
addresses as if they were internet addresses. They are not.

It is certainly no surprise that strange things happen when you
do this! It is a lot like attempting to call someone on the
telephone using their street address: it does not work.

Please reply via e-mail ... particularly those of you who
volunteer to write the user documentation we so badly need !

        HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

 I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

 System Name: WB3FFV
 User Login: bbs

 Number: (301)-625-0817 -- 1200,2400,4800,9600,19200,38400
                           (V.32/V.42/V.42bis/MNP1-5)

 Number: (301)-625-9482 -- 1200,2400,4800,7200,9600,12000,14400,19200,38400
                           (V.32/V.32bis/V.42/V.42bis/MNP1-5/HST)

 Number: (301)-625-9663 -- 1200 & 2400 (MNP1-5), 9600 & 19200 (PEP)

 Data Settings: 8 Bits, NO Parity, 1 Stop Bit
 Times: 24hrs/365days (except for routine maintenance)
 Software: XBBS (UNIX/Xenix Multiuser BBS) Version 7.91u
 IP Address: 44.60.128.1 {wb3ffv.ampr.org} [for FTP access on 145.650 mhz ONLY]

Misc. Info: Machine is an 80486 computer running UNIX V.3.2 and features 800
Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS] (Version 1.2 & 1.3)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.1[2,3,4])
W0RLI BBS for the PC (Versions 10.xx, 11.xx, 12.xx, 13.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.07-1.11)
AA4RE BBS for the PC (Version 2.11)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01 1.16 & 2.06)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

Lighten up Lyndon ... there was no mistake ... the country codes were already
defined by the ITU in a document ... see our paper in the 7th CNC ...

I fail to see what trouble this is causing anyone ... as you point out,
it is not causing the problem that the gateways may have -- that is rooted
in the flat domain we seem to have ... and folks seem to be working around
that too ...

You are correct - these are 2 separate networks -- and the interesting thing
is that the bbs side has now moved so much mail that the purists awaiting
a Utopian network will never catch up ... new standards are being set - that
may upset those that feel that the wheel is being reinvented, but I think that
the jury is still out as to whether land-line defined systems are going to
survive a whole-scale, non-optimized move to radio ...

I guess I have a hard-time understanding why there is so much discontent
that someone is actually providing the service element of this, while the
"theorists" are left to their ivory towers to ponder the meaning of packet
existence, which is hwere they say they want to be ?!

Oh, crap, Dave.

There *are* people working on the "service element".
  Somewhat slowly, since there's little point to providing "services"
  on a network that doesn't work. I can't get very excited about providing
  21st century services on a network that is currently firmly planted in
  the late 1960s. Real-world "wired" networks move orders-of-magnitude
  more mail/news/files with much higher reliability than the network you
  hold up as a shining example. That paradigm *can* be moved into the
  packet-radio domain, but until we get more buy-in from die-hard
  NETROM/PBBS/AX.25 addicts, progress is going to be slow and tedious.

Until we "ivory tower types" can get a decent highspeed/modern network in
  place, there is little point in providing whizzo services.

  My comments with "***" (no, I don't have a good news poster
  available ... sorry).

Note that the country identifiers chosen by the packet network correspond to ISO 3166-1981(E/F). This is part of the EDIFACT standard, and is in much wider use than any other standard I'm personally aware of. These are 3 letter ids. We chose two letter continent IDs for no particular reason. Changing to 4 letter continent IDs would not change much of anything, the underlying problem remains the same.

If there are other standards we bbs authors should consider, we need to be made aware of them. At least some of us come from a world far from unix, where we have moved data around the world since way before unix existed ...

We don't all have access to the various standards documents referenced in this thread. PLEASE SEND US COPIES VIA E-MAIL! If we knew what you were all talking about, we might actually go and do something!

If you think about the structure of the packet radio network, how it interconnects, you will see major differences with the way a wired network (e.g. the various parts that make up the internet) work. The standards developed for the packet network function in different ways because they need to ...

... Hank - W0RLI

From: e2grwill@snap.adelaide.edu.au (Grant Willis VK5ZWI)
Subject: Re: 'NA' country domain appears to be non-unique
Keywords: Packet BBS Version of Internet RFC's
Message-ID: <4128@sirius.ucs.adelaide.edu.au>

I guess a problem like this had to crop up eventually, but I think it exposes a larger underlying problem with the Packet Radio BBS Network. I have been a BBS SysOp for a couple of years now and have also been involved in writing a BBS Program (RTTYGate RTTY><Packet Gateway). In that time I dont recall seeing any documents that set down the standards for the operation of the BBS system.

I have seen several discussion documents (and would love to see the one explaining the 4 letter continent designators) on mainly the Hierarchial addressing but nothing on how BBS forwarding is supposed to be conducted, how headers should be formulated and only small amounts on White Pages and BID/MID's. All of these seemed to be worded like DISSCUSSION doccuments, or passed on because the majority of the existing software does whatever function a particular way, and not really as standards.

Thinking about these things and also the current problem of the NA ** LOCATION ** code on the BBS Network and *.na top level Internet Domain, I started to wonder whether the Software writers and Packet

Operators should put together a set of Packet BBS "RFC like" documents,
called for example PBS's (Packet BBS Standards)? (if they dont already
exist, or if they do, make them much more widely known and formalised).

If such a set of standards existed, it would be a good starting place
for those wishing to write BBS software, and a good starting point to
modify existing code to produce a uniform network. Aspects that could be
formalised may include,

*** > BBS Feature ID - SID grammer and use. Assigned feature IDs.
BBS Forwarding - Definition of Forwarding Dialogue
BBS Forwarding - BBS Header Standards
BBS Forwarding - Definition of Standard Compression Algorithm
BBS Addressing - Hierarchial Address Definition and Location Codes
BBS Addressing - Hierarchial Address - Parsing Procedure
BBS Addressing - Bulletin BID Definition, Message MID Definition
BBS Operation - Gatewaying
BBS Operation - White Pages

just to name a few!

It is pretty obvious that this will be a monster task, but then can
we afford not to do it? As the BBS net becomes more and more
connected to other networks, problems like the NA Address will no
doubt become more prevelent. Getting all BBS Software to conform
will take time as new versions will need to be written and the
Thousands of BBS's world wide upgrade to the new software but I
think it is a step that should be taken.

I would like to hear others thoughts on this. I am not volenteering
to write them, that should be a co-operative activity amongst ALL
BBS software writers but I do believe that if we dont move in
a similar direction to this that the Packet Network will run into
more and more problems in the future.

Cheers de Grant VK5ZWI

*** I distribute a set of documents with my code that describe
*** the standards presently in use for all of the items you
*** mention. They would make a starting point. Please e-mail

I think this is a good idea. At present just about the only way you can
implement a new feature that someone else has come up with is to get a copy
of their software, run it, and try to work out the protocol (or whatever).
This is obviously far from ideal.

I think the problem stems from the fact that we started off with only one or two BBS programs, and the authors of those programs managed to keep them fairly compatible. However, there are now people all over the world writing BBS software, and a lot of them don't know what is happening in other countries. It also seems that everyone wants to change something just to make their system stand out from the others (just look at all the different headers).

As you say, it will probably be very difficult to come up with a set of standards that everyone will agree to, but if we don't start doing it now then it will soon become impossible.

Brian G1NNA

*** Brian, if we (the various authors) all exchanged information via the
*** packet network, we could remain in synch. For example, I plan to
*** implement rfc-822 style forwarding in my next release. I'll probably
*** just choose a random SID feature ID ("R" ?, no Roy has used that,
*** "S" ?, seems to be unused ...).
*** As a longer term solution, we need a coordinating body. Oh no ...
*** i.e. a clearing house that can collect and distribute the required
*** information. Many of us have asked ARRL to take on this function.
*** They have refused. Perhaps (RSGB / WIA / PRUG) would be interested?
*** We also need coordination and distribution of MANY other data.
*** Example: bulletin grouping and distribution designators.
*** It's time to move ahead with the 'next step' in the packet BBS network.
*** We've been at about the same place for seven years now ...

I have heard that there are packet<->internet gateways, although they must be monitored before going out over the air. Does anyone have any

information on any of these gateways and how to use it?

I've got my tech ticket, but no access to packet yet, and I wanted to
drop a note to N6KK in california.

In response to Brian Kantor's observations:
I cannot say why they chose the . as the separator ...
I believe that they (Hank) felt that it would not be a problem, and I
believe he still believes that ... I think he does read the list (or at
least tcp-group) so he may hop in here ...
Personally, I do not user the continental codes in routing. I am not
convinced that you can base routing on continents, when Israel and Japan
are both in Asia ...
So to answer your question, no, the country codes are not too long to
search ...
I aplogozize for missing the start of this thread - is the continental
designator somehow the big stumbling block ???

And you mean to tell me that you are not fully X.400 yet ???

Someone has to be the first ! <grin>

I would like to know how KISS works. What is the format of the
frames? What about extensions such as parameter setting? I have the
impression it's a pretty simple protocol.

Has anyone ever seen a description of KISS? Or does everyone
just figure it out from various hunks of source code?

And no, I don't know how SLIP works either if that makes
any difference (I heard it was like KISS).

Thanks,
Bruce Walzer VE4XOR

Yep, sure is. If you can anonymous ftp, ftp to ucsd.edu, cd to
hamradio/ka9q/arrl/1987, and get kisstnc.ms.Z, binary-wise. Uncompress,

and nroff -ms it!

Cheers,

hanko@mentorg.com (Hank - W0RLI) writes
[some reasonable comments, and some others:...]

" If there are other standards we bbs authors should consider,
  we need to be made aware of them. At least some of us come
  from a world far from unix, where we have moved data around
  the world since way before unix existed ..."

Two problems: One, I assume you're not trying to imply packet electronic
mail existed before Unix. Or that it even existed before TCP/IP.
There were and are standards that could be applicable. Although I
do not understand how one could avoid knowing of the
RFCs, I'm sending you by email a copy of the index. Any you need,
let me know & I'll send those on.

" If you think about the structure of the packet radio network,
  how it interconnects, you will see major differences with the
  way a wired network (e.g. the various parts that make up the
  internet) work. The standards developed for the packet network
  function in different ways because they need to ..."

Yes, there are *some* differences {most notably in that the packet radio
net is not fully connected}. In fact, the current packet BBS system
looks a lot like Usenet (systems connected only thru UUCP). The standards
we are talking about do not, however, "function in different ways because
they need to" {your quote}. Functionally, I think the packet BBS system is
identical to Usenet -- yet there are different schemes. Probably 'cause

different people thought them up without really looking at one another's work.

It's true that the Internet naming & mail system is not the *only* one around. It's also true that the BBS s/w did *not* directly cause the problem that started this thread. It *is* true that protocols that may have evolved in isolation should take into account the current environment, which includes SMTP & UUCP & the Domain Name System. The code written by you and others has been a great help in getting packet BBS mail exchange started. Don't assume it shouldn't grow or change.

Want a specific hint? (1) Don't use "." as the separator in your geographical routing. (2) Separate routing hints from a user's address {might help for really mobile stations}.

BTW, while sending this I tried to send you mail, with the result shown below. If you'll send mail to willis@cs.tamu.edu, I'll try to reply.

Hi all,
        This may not be the best place, but can anyone give me some
references to research papers involving digital radio communications,
which were written by amateurs. I am currently knocking up a paper
about packet/Internet gateways to sway the minds of some of the Universities
here in Oz (who `control' Internet access), and need to be able to place
amateur packet activity on a research footing. So any references, such as
ftp sites, abstracts, proceedings etc.) would be most welcome.

Thanks,

       Warren Toomey VK1XWT, cold but happy
      Deep in the bowels of ADFA Comp Science.

I'm looking at a message, posted to rec.ham-radio.packet, back in December
of '89. This message describes an extension to the KA9Q attach command, to
support modem-dialing. Syntax is:

  attach <hw type> <I/O address> <vector> <mode> <label> <bufsiz> <mtu>
         [<speed>] [[optional '-' for debug] <send> <expect <send> [...]]

However, when I enter:
  attach asy 0x3f8 4 slip sl0 1024 256 9600 - ATDT5551212 CONNECT

NOTHING is sent to the modem, and the NOS prompt returns.
I've got NOS1130D.EXE. The doc that came with it describes a "DIALER" command,
that my NOS does not recognize as a valid command.

What do I have to do to get KA9Q do dial a modem for SLIP?

Find below the official PACTOR information brief from the WAA Group.
Any uncomprehensible errors is probably due to the laser scanner and
the accompaning translation software.

****

THE WAA GROUP 4/91

P A C T 0 R Short system description

1. Introduction

AMTOR and PACKET RADIO (PR) have become rather popular ARQ techniques in Amateur Radio. Nevertheless, concerning poor-quality channels, their performance is far from optimum. AMTOR, matched to old mechanical teletype technology, represents the state-of-the-art some 20 years ago; PR was adopted from the X.25 protocol for data exchange on high-quality telegraph lines.
PACTOR (PT), specially designed for operation in noisy and fluctuating channels, is an improved half-duplex synchronous ARQ system combining the reliability of PR with the fixed AMTOR time frame.

Principal design considerations:

PACTOR comprises all important AMTOR or PR (2-way) characteristics:

- fixed timing structure and full synchronism to ensure maximum speed
- fast and reliable changeover / break-in
- required bandwidth less than 600 Hz
- 100% ASCII compatible (true binary data transmission)
- extremely low probability of undetected errors (16 bit CRC)

- independent of shift polarities
- no multi-user overhead in a narrow-band channel
- inexpensive hardware (Z80 single-board)
- high operational comfort (built-in message storage system, etc.)
- listen-mode (monitor)
- FEC-mode (CQ-transmissions etc.)

As a novelty in Amateur RTTY, some additional powerful features have been realized:

- optional coherent mode, i.e. system clocks locked to frequency standards (e.g. DCF77, TV deflection signals and other high precision broadcasts)
- online data compression (Huffman coding)
- automatic speed change (1001200 baud) without loss of synchronization
- fully acknowledged link termination (no QRT-timeout required)
- memory ARQ (even noisy packets can be restored)

II. Some system details

1 . Timing

The basic PT transmission frame is very similar to AMTOR; blocks (packets) containing data information are acknowledged by short control signals (CS) sent out by the receiving station.
Shift levels are toggled with every cycle in order to support memory ARQ (see below). Since the shift polarity is clearly definined at synchronization time, any conventions concerning 'mark / space' become obsolete.

```
cycle duration   1.25 sec
packets          0.96 sec = 192 (96) bits at 200 (100) baud
control signals: 0.12 sec = 12 bits, each 10 msec long
CS-receive gap : 0.29 sec
```

Change of transmission speed only alters the internal packet structure; all other timing parameters remain constant.

2. Packets

General packet structure:

/header/..20 (8) data bytes at 200 (100) baud../status/CRC/CRC/

header	This byte enables fast synchronization and delivers auxiliary information (memory ARQ, listen mode)
data	arbitrary binary information
status	system control byte (2 bit packet number, tx-mode, break-in, request, QRT)

CRC 16 bit cyclic redundancy check based on CCITT polynomial X^16+X^12+X^5+1, calculated over the entire packet (except header)

3. Control signals (CS)

Four CS are used. As a compromise between reliability and fast detection, a CS length of 12 bit was chosen.

CS1: 4D5, CS2: AB2, CS3: 34B, CS4: D2C (all hex numbers, LSB right)

The mutual Hamming distance is 8 bit, thus minimizing the chance of receiving a false CS. CS1/2 and CS3/4 form symmetrical pairs (bitreverse patterns).

CS1..3 have the same function as their AMTOR counterparts; CS4 serves as the speedchange control. In contrast to AMTOR, CS3 is transmitted as head portion of a special changeover packet (see below).

4. Starting a PACTOR contact

The calling station ('master') sends special synchronization packets:

/head (100bd)/..address (8 bytes, 100bd)../..address (6 bytes, 200bd)/

Normally, the receiver only uses the 100-baud-section to achieve a fast synchronization. The 200-baud-section supplies additional information about the channel quality: if it is received correctly, the first CS will be CS4, otherwise CS1 is sent. After in turn having synchronized a CS4 or CS1, the master will continue with sending normal data packets at 200 or 100 baud, respectively. The first transmitted characters contain the 'system level number' (PACTOR software-version), followed by the master address (callsign).

5. Changing the transmission direction

Similar to AMTOR, the receiving station (RX) can change the transmission direction whenever it has received a valid packet. For this purpose a special changeover-packet is transmitted, starting at the CS time frame. The transmitting station (TX) will switch to RX mode immediately after it has received the CS3 which forms the first section of the changeover-packet. It then reads in the rest of that packet and transmits a CS (CS1 and CS3 = acknowledge, CS2 = reject) timed at the last three bytes of the former packet frame. To force a break in, the TX sets the BK-status-bit (this corresponds to AMTOR '+?').

6. Speedchange

Speeddown only being useful in poor conditions or at low data input

rates (e.g. manual typing), both directions are treated unsymmetrically .

i) Speeddown

The RX may request speeddown after any incorrectly received packet by sending CS4, which immediately forces the TX to build up 100-baud-packets (any unconfirmed 200 baud information is repeated at low speed) .

ii) Speedup

Any valid packet may be confirmed with CS4, forcing a TX speedup. In case the following high-speed-packet is not acknowledged after a number of tries, the TX will automatically perform a speeddown.

7. Termination of a PACTOR contact

Cutting an ARQ link inevitably leads to the problem that information has to be transmitted without final acknowledgement. PT applies special QRT packets, providing an expensive but rather effective solution. These packets contain an active QRT status bit and the RX address in byte-reverse order (low speed pattern). If this address is found during the standby synchronization procedure, the RX responds with a single transmission of the final CS (The timing relations before stby are stored). This method will always guarantee a well-defined QRT.

8. Data Compression

Character frequency analysis of typical english or german texts shows that the average amount of information per character does not exceed 4 bits. For that reason, ASCII text transmissions often carry a redundancy of 50%, which could be avoided by using a variable length code matched to the character distribution. The most popular example of such a code is the Morse code; PACTOR data compression mode applies Huffman coding with nearly optimum efficiency, yielding up to 100% speed gain. Every packet contains a compressed data string; character code lengths vary from 2 to 15 bits.

9. Memory ARQ

In conventional ARQ systems the TX has to repeat a packet until it has been received completely error-free. It is evident that the probability of receiving a complete packet dramatically decreases with lower S/N ratio. The only way to maintain the contact in that case is to shorten packet length and/or to apply error correcting codes which in turn will greatly reduce maximum traffic speed when conditions are good.
The method chosen by WAA Research Group is to sum up corresponding bit

samples of subsequent packets and to test if the mean value (reduced to a 0/1-decision) passes the CRC. To keep quantizing errors small, the samples are taken from the FSK-demodulator low-pass-filter output by means of an 8-bit AD-converter. Assuming white Gaussian noise, this accumulation method - also known as 'memory ARQ' - will obviously converge even at a low S/N ratio. Furthermore, since shift levels are toggled with every transmission, constant interfering signals within

the receiver passband will not affect the resulting mean value. To prevent accumulation of old request packets, the header is inverted with every new information packet, thus serving as a RQ indicator (similarity test).

10. Listen Mode (Monitor)

This mode resembles Packet Radio monitoring: the receiver scans for valid packets which are detected by CRC match. This 'brute force' method was chosen in order to ensure maximum flexibility, although it consumes a considerable amount of the available CPU capacity.

11. FEC Transmissions

CQ and bulletin transmissions are supported by means of a special non-protocol mode. Packets are transmitted with one or more repetitions; the CS receive gap is omitted. Since the listen mode does not require synchronization, the transmitting station possesses great freedom of selecting packet repetition rate and speed.

12. Practical Aspects

The first PACTOR programs were running on 'breadboarded' Z80 single-board-computers. These early experiments led to the development of a stand-alone 'PACTOR-Controller' with built-in modem and tuning-display. The conventional operating modes BAUDOT and AMTOR were added in order to maintain compatibility and - what might be more interesting - to allow easy comparisons. Assuming typical conditions, PACTOR traffic can be expected to run 4 times faster than over a AMTOR link.

PTC, The PACTOR-Controller

After a long period of development and test...

The hardware for the new ARQ radioteletype mode called PACTOR, presented in the German HAM-Magazine cq-DL 11/90, is now available. The PTC consists of two boards, the mainboard (100 x 160mm) and a frontpanel. It has the following features:

* Modes: PACTOR, AMTOR (ARQ, FEC, Listen), RTTY.
* Special features of PACTOR:
    - Error free data transmission, 4 times faster than AMTOR
    - Complete ASCII dataset on one level available
    - Memory-ARQ, bad data packages are restored
    - Online data compression (Iluffman Algorithm)
    - Automatic speed adaption depending on RF-conditions (100 Bd, 200 Bd)
    - Unproto mode (FEC)
    - Listen mode (to observe PACTOR QSOS)
    - CW identification every 7 minutes and at QRT
* Connectors: RS232, Power, Transceiver
* Power supply: 9... 14VDC, 2OOmA
* Developed in CMOS/HCMOS technology as far as possible
* Digital tuning control: 8 LEDs
* Comfortable status display: 12 LEDs
* Demodulator with A/D converter and switched capacitor filters
* Easy calibration by software support
* Lithium battery buffered realtime clock

```
     * Automatic Logbook function, battery buffered
     * Build in PMS system (personal mailbox), also battery buffered

  The PACTOR mode has been developed by DF4KV and DL6MAA, the whole
  PACTOR Group also includes DL3FCJ, DL2FAK, DLLZAM, DK5FIl and DF4WC.

  Ordering-Conditions:  A PTC can be delivered completely assembled or
  as a kit including all parts.

  PTC assembled and calibrated        390$
  PTC kit including all parts         320$
  Payments are due in advance.

  For further information see the corresponding articles soon published
  in several Amateur Radio magazines.  If these publications do not
  answer all questions feel free to write to the address below, SAE and
  IRC (or 1$) should be included for convenient and delighting processing.

Oh, crap, Dave.

There *are* people working on the "service element".
  Somewhat slowly, since there's little point to providing "services"
  on a network that doesn't work. I can't get very excited about providing
  21st century services on a network that is currently firmly planted in
  the late 1960s. Real-world "wired" networks move orders-of-magnitude
  more mail/news/files with much higher reliability than the network you
  hold up as a shining example. That paradigm *can* be moved into the
  packet-radio domain, but until we get more buy-in from die-hard
  NETROM/PBBS/AX.25 addicts, progress is going to be slow and tedious.

Until we "ivory tower types" can get a decent highspeed/modern network in
  place, there is little point in providing whizzo services.

Subject: BBS Mail Standards -- Stagnant or Evolving?
Date: 1 Aug 91 22:48:27 GMT
Sender: usenet@helios.TAMU.EDU

hanko@mentorg.com (Hank - W0RLI) writes
[some reasonable comments, and some others:...]

" If there are other standards we bbs authors should consider,
  we need to be made aware of them. At least some of us come
  from a world far from unix, where we have moved data around
  the world since way before unix existed ..."

Two problems: One, I assume you're not trying to imply packet electronic
mail existed before Unix. Or that it even existed before TCP/IP.
There were and are standards that could be applicable. Although I
do not understand how one could avoid knowing of the
RFCs, I'm sending you by email a copy of the index. Any you need,
let me know & I'll send those on.

*** Ummm ... yes, I did indeed imply that e-mail existed before unix.
*** Didn't say anything about 'packet' since the transmission protocol
*** really makes little difference. I've used e-mail since about 1967.
*** Wrote my first e-mail system in about 1969 or 1970. No, it had
*** nothing to do with packet, unix, or the internet. It had a little
*** bit of influence from and on early arpanet. i.e. PDP-11 and mainframe
*** technology using at first bisynch and asynch connections, and later
*** on early packet technology. Moved away from that stuff in about
*** 1972 and have been doing other things since. Thus no access to the
*** various rfcs unless someone sends them to me. Will send you a list

*** of those that I'm missing. In particular, I need up-to-date copies
*** of x.400 and x.500 and rfc-1036. I do have rfc-822 itself.

" If you think about the structure of the packet radio network,
how it interconnects, you will see major differences with the
way a wired network (e.g. the various parts that make up the
internet) work. The standards developed for the packet network
function in different ways because they need to ..."

Yes, there are *some* differences {most notably in that the packet radio net is not fully connected}. In fact, the current packet BBS system looks a lot like Usenet (systems connected only thru UUCP). The standards we are talking about do not, however, "function in different ways because they need to" {your quote}. Functionally, I think the packet BBS system is identical to Usenet -- yet there are different schemes. Probably 'cause different people thought them up without really looking at one another's work.

*** The major difference (from a routing point of view) is that the
*** connectivity changes on a short term basis. As far as I know, the
*** network is indeed fully connected, but NOT at layer 2, for example.
*** If you think top down, from a layer 7 viewpoint, then it is indeed
*** fully connected. As an application writer, my main interest is
*** in those things that support layer 7 services. The fact that the
*** best we can do right now is layer 4 (with some implied layer 5/6
*** interfaces) does not stop me from creating useful applications,
*** it just makes it a whole lot harder.

It's true that the Internet naming & mail system is not the *only* one around. It's also true that the BBS s/w did *not* directly cause the problem that started this thread. It *is* true that protocols that may have evolved in isolation should take into account the current environment, which includes SMTP & UUCP & the Domain Name System. The code written by you and others has been a great help in getting packet BBS mail exchange started. Don't assume it shouldn't grow or change.

*** We also need to take into account other existing standards, for example
*** those standards promulgated by the United Nations. I'm speaking,
*** of course, of EDIFACT and x.12 and all the ISO work on domain namings.
*** The fact that usenet has chosen to ignore that standards work and go
*** off on it's own is no excuse ...

Want a specific hint? (1) Don't use "." as the separator in your geographical routing. (2) Separate routing hints from a user's address {might help for really mobile stations}.

*** Oh fudd ... the problem is not in the name, nor in the grammer of
*** the name. The problem is with the software that uses the names.
*** The internet name domain and the packet BBS name domain are disjoint.
*** There is the obvious cure: gateways need to handle the names properly.
*** We could establish a simple convention: for example, append .ampr.org
*** to the BBS net names when they are displayed in the internet world.

BTW, while sending this I tried to send you mail, with the result shown
below. If you'll send mail to willis@cs.tamu.edu, I'll try to reply.

*** Try hank_oredson@mentorg.com
*** We are in process of improving our connections with the world,
*** and guess what? Old names don't work. Now if this was the BBS net,
*** you could just query WP and find out where I was ... but it isn't ...
*** i.e. usenet technology lags behind BBS net technology in many ways.
***

This was a hack I added to NET (Pre-NOS) to allow my HP Portable Plus to
connect to the HP-UX (Series 500 at that time) at work via the Plus's
internal modem.

The hack appeared to work OK on the PC and was included in the then
current revision of NET by Bdale, N3EUA. The last release of NET which
had that version of the attach command was 890421.1, I believe.

Current versions of NOS include the 'tip' command which obsoletes my hack.
If your version of NOS doesn't include the 'tip' command, you should update.

Is there anybody that can tell me how to connect an IC-2GE to PK-232 ?

I have tried the following

This seems to work well i calibrate mode with both low and high tones, but
when i try to run packet radio PK-232 doesn't manage to activate the
transmitter. Any ideas ??

Well I have but one question....

Has anyone had any experence in re-writing the source code in
the Eproms used in TNC's? I am looking for a source code listing so as to
re-write the one used in a MFJ-1270B. I am also intrerested in the one for
the MFJ-1274.

What my goal is to use the mailbox code from the 1270 or 1274 and add it
to the WA8DED multi-connect firmware.

Any information or help would be much appreciated.

I am however quite proud on that it goes with software that is
entirely sharewre and/or in the public domaine. Some day they will
even finish the news software for uupc/extended and I can put it up to
read the interesting threads ony my own box (lisse.NA, a very old AT
with 1MB, 4dos and uupc 1.10a)

>One solution for him, for whom I have deep sympathies, would

You can not imagine hown mavelously expensive a 386 or anything better
is around here. I am not payed too bad, though not handsomely either,
but I cannot currently afford the 386SX that I need to run even smail
and/or news. I have thought about this for some months but ...

>Have some pity on him - he's a medical doctor trying to undo some
>of the land mine damage done by my country on the locals.

Please, I feel ashamed when you say this, my own country (Germany)
wasn't any better to the locals. I am just trying to do my job as good
as I can (as I would anywhere).

Now if some foundation would be willing to pitch in the smallest possible 386(SX) with a large hard disk or two medium sized ones, a tape drive and at least 4MB of memory it really would come to good use.

>Another thing that you can do is to change the format of the

Anyway,

it was a fascinating experience to create this thread and to follow it, though I must say that I do not understand anything of some messages recently posted in this particular group, but this would be in line with the theme :-)-O, right?

Now if the postmasters of the hosts uk.ac.*.NA (there are at least two) were answering me :-)-O? But JANET is another thread.

>><grin>

>Yes, well if this is your attitude then nothing will happen to
>correct the situation, and good old North America will simply
>steamroll over yet another developing country.

I personally think this will happen.

There are several packet radio operators who are in a position and willing to help and anyway, internet can take care of us (by way of CNAMEs).

If everything had come to the worst, I think the FCC might have been quite interested.

greetings, el

ps: I am the poor sucker trying to get our litlle university to sign an agreement, trying to find some sponsors to get us a line (1000$ per month), trying to find a 386 to get us going, trying to find a 9600 modem, trying to keep smiling :-)-O (Which is my contribution to the smileys, a smiling doctor with stethoscope, in case someone wondered.)

There is absolutely nothing wrong with a gateway, and there is nothing
that you can do to any gateway to fix the problem. Gateways on the
Internet are _correctly_ routing .NA email to Namibia via the .ZA
link to the USA.

The problem is that certain folk (who have packet radio email addresses)
put into their signatures something like

"my email address on the packet radio network is some.where.in.NA"

So the PDU   (your words not mine, I think that this
               problem is by no means limited to a dumb user)

who is on the Internet or other (non-packet) email
network decides to use the packet address (which looks exactly like
                            an Internet address, hell,
                            how many folk in North
                            America spend very much time
                            thinking that NA is Namibia?)

which results in the message being delivered
perfectly correctly as far as the gateways
etc are concerned   (but, of course to the wrong
                            network, because .NA is
                            Namibia, not North America)

and we pay for this brain-damaged design
of the packet-radio address space (because the message crosses
the Atlantic twice at our
expense)

and the poor sucker who is trying to get the
Namibian networking going on a shoestring
under conditions that you in a high-tech country
cannot possible imagine gets hit with your goddamn
email and has to deal with it by hand because he
has no better hardware or software to do this
goddamn job automatically.

One solution for him, for whom I have deep sympathies, would
be for you packet radio types to sponsor him for a SUN or
other Un*x box so that he can at least automate this bouncing.

Have some pity on him - he's a medical doctor trying to undo some
of the land mine damage done by my country on the locals.

Another thing that you can do is to change the format of the
signatures of those folk who use the packet radio network. Stop
them from publicising the format

    packet: user@some.where.in.NA

Best of all is to get into line with what the Internet laid down
for email addresses, and don't use the two letters .NA to
mean "North America's packet radio network". Surely you folk
are bright enough to implement this?

><grin>

Yes, well if this is your attitude then nothing will happen to
correct the situation, and good old North America will simply
steamroll over yet another developing country.

Does anyone know how an application program can send a UI packet thru
the new BPQ HOST interface? Packets to disconnected channels seem to
be ignored and I rather not build the whole packet myself and send it
via KISS.

I sent some notes to G8BPQ a while back but never heard anything.

Any help would be greatly appreciated.

  PTC, The PACTOR-Controller

  After a long period of development and test...

  The hardware for the new ARQ radioteletype mode called PACTOR, presented
  in the German HAM-Magazine cq-DL 11/90, is now available. The PTC
  consists of two boards, the mainboard (100 x 160mm) and a frontpanel.
  It has the following features:

     * Modes: PACTOR, AMTOR (ARQ, FEC, Listen), RTTY.
     * Special features of PACTOR:
         - Error free data transmission, 4 times faster than AMTOR
         - Complete ASCII dataset on one level available

- Memory-ARQ, bad data packages are restored
- Online data compression (Iluffman Algorithm)
- Automatic speed adaption depending on RF-conditions (100 Bd, 200 Bd)
- Unproto mode (FEC)
- Listen mode (to observe PACTOR QSOS)
- CW identification every 7 minutes and at QRT

* Connectors: RS232, Power, Transceiver
* Power supply: 9... 14VDC, 2OOmA
* Developed in CMOS/HCMOS technology as far as possible
* Digital tuning control: 8 LEDs
* Comfortable status display: 12 LEDs
* Demodulator with A/D converter and switched capacitor filters
* Easy calibration by software support
* Lithium battery buffered realtime clock
* Automatic Logbook function, battery buffered
* Build in PMS system (personal mailbox), also battery buffered

The PACTOR mode has been developed by DF4KV and DL6MAA, the whole PACTOR Group also includes DL3FCJ, DL2FAK, DLLZAM, DK5FIl and DF4WC.

Ordering-Conditions: A PTC can be delivered completely assembled or as a kit including all parts.

PTC assembled and calibrated 390$
PTC kit including all parts 320$
Payments are due in advance.

For further information see the corresponding articles soon published in several Amateur Radio magazines. If these publications do not answer all questions feel free to write to the address below, SAE and IRC (or 1$) should be included for convenient and delighting processing.

THE WAA GROUP 4/91

P A C T 0 R Short system description

1. Introduction

AMTOR and PACKET RADIO (PR) have become rather popular ARQ techniques in Amateur Radio. Nevertheless, concerning poor-quality channels, their performance is far from optimum. AMTOR, matched to old mechanical teletype technology, represents the state-of-the-art some 20 years ago; PR was adopted from the X.25 protocol for data exchange on high-quality telegraph lines.
PACTOR (PT), specially designed for operation in noisy and fluctuating channels, is an improved half-duplex synchronous ARQ system combining the reliability of PR with the fixed AMTOR time frame.

Principal design considerations:

PACTOR comprises all important AMTOR or PR (2-way) characteristics:

- fixed timing structure and full synchronism to ensure maximum speed
- fast and reliable changeover / break-in
- required bandwidth less than 600 Hz
- 100% ASCII compatible (true binary data transmission)
- extremely low probability of undetected errors (16 bit CRC)
- independent of shift polarities
- no multi-user overhead in a narrow-band channel
- inexpensive hardware (Z80 single-board)
- high operational comfort (built-in message storage system, etc.)
- listen-mode (monitor)

- FEC-mode (CQ-transmissions etc.)

As a novelty in Amateur RTTY, some additional powerful features have been realized:

- optional coherent mode, i.e. system clocks locked to frequency standards (e.g. DCF77, TV deflection signals and other high precision broadcasts)
- online data compression (Huffman coding)
- automatic speed change (1001200 baud) without loss of synchronization
- fully acknowledged link termination (no QRT-timeout required)
- memory ARQ (even noisy packets can be restored)

II. Some system details

1 . Timing

The basic PT transmission frame is very similar to AMTOR; blocks (packets) containing data information are acknowledged by short control signals (CS) sent out by the receiving station.
Shift levels are toggled with every cycle in order to support memory ARQ (see below). Since the shift polarity is clearly definined at synchronization time, any conventions concerning 'mark / space' become obsolete.

```
cycle duration   1.25 sec
packets          0.96 sec = 192 (96) bits at 200 (100) baud
control signals: 0.12 sec = 12 bits, each 10 msec long
CS-receive gap : 0.29 sec
```

Change of transmission speed only alters the internal packet structure; all other timing parameters remain constant.

2. Packets

General packet structure:

/header/..20 (8) data bytes at 200 (100) baud../status/CRC/CRC/

header	This byte enables fast synchronization and delivers auxiliary information (memory ARQ, listen mode)
data	arbitrary binary information
status	system control byte (2 bit packet number, tx-mode, break-in, request, QRT)
CRC	16 bit cyclic redundancy check based on CCITT polynomial X^16+X^12+X^5+1, calculated over the entire packet (except header)

3. Control signals (CS)

Four CS are used. As a compromise between reliability and fast detection, a CS length of 12 bit was chosen.

CS1: 4D5, CS2: AB2, CS3: 34B, CS4: D2C (all hex numbers, LSB right)

The mutual Hamming distance is 8 bit, thus minimizing the chance of receiving a false CS. CS1/2 and CS3/4 form symmetrical pairs (bitreverse patterns).

CS1..3 have the same function as their AMTOR counterparts; CS4 serves as the speedchange control. In contrast to AMTOR, CS3 is transmitted as head portion of a special changeover packet (see below).

4. Starting a PACTOR contact

The calling station ('master') sends special synchronization packets:

/head (100bd)/..address (8 bytes, 1OObd)../..address (6 bytes, 2OObd)/

Normally, the receiver only uses the 100-baud-section to achieve a fast synchronization. The 200-baud-section supplies additional information about the channel quality: if it is received correctly, the first CS will be CS4, otherwise CS1 is sent. After in turn having synchronized a CS4 or CS1, the master will continue with sending normal data packets at 200 or 100 baud, respectively. The first transmitted characters contain the 'system level number' (PACTOR softwareversion), followed by the master address (callsign).

5. Changing the transmission direction

Similar to AMTOR, the receiving station (RX) can change the transmission direction whenever it has received a valid packet. For this purpose a special changeover-packet is transmitted, starting at the CS time frame. The transmitting station (TX) will switch to RX mode immediately after it has received the CS3 which forms the first section of the changeover-packet. It then reads in the rest of that packet and transmits a CS (CS1 and CS3 = acknowledge, CS2 = reject) timed at the last three bytes of the former packet frame. To force a break in, the TX sets the BK-status-bit (this corresponds to AMTOR '+?').

6. Speedchange

Speeddown only being useful in poor conditions or at low data input rates (e.g. manual typing), both directions are treated unsymmetrically .

i) Speeddown

The RX may request speeddown after any incorrectly received packet by sending CS4, which immediately forces the TX to build up 100-baud-packets (any unconfirmed 200 baud information is repeated at low speed) .

ii) Speedup

Any valid packet may be confirmed with CS4, forcing a TX speedup. In case the following high-speed-packet is not acknowledged after a number of tries, the TX will automatically perform a speeddown.

7. Termination of a PACTOR contact

Cutting an ARQ link inevitably leads to the problem that information has to be transmitted without final acknowledgement. PT applies special QRT packets, providing an expensive but rather effective solution. These packets contain an active QRT status bit and the RX address in byte-reverse order (low speed pattern). If this address is found during the standby synchronization procedure, the RX responds with a single transmission of the final CS (The timing relations before stby are stored). This method will always guarantee a well-defined QRT.

8. Data Compression

Character frequency analysis of typical english or german texts shows that the average amount of information per character does not exceed 4 bits. For that reason, ASCII text transmissions often carry a redundancy of 50%, which could be avoided by using a variable length code matched to the character distribution. The most popular example of such a code is the Morse code; PACTOR data compression mode applies Huffman coding with nearly optimum efficiency, yielding up to 100% speed gain. Every packet contains a compressed data string; character code lengths vary from 2 to 15 bits.

9. Memory ARQ

In conventional ARQ systems the TX has to repeat a packet until it has been received completely error-free. It is evident that the probability of receiving a complete packet dramatically decreases with lower S/N ratio. The only way to maintain the contact in that case is to shorten packet length and/or to apply error correcting codes which in turn will greatly reduce maximum traffic speed when conditions are good.
The method chosen by WAA Research Group is to sum up corresponding bit samples of subsequent packets and to test if the mean value (reduced to a 0/1-decision) passes the CRC. To keep quantizing errors small, the samples are taken from the FSK-demodulator low-pass-filter output by means of an 8-bit AD-converter. Assuming white Gaussian noise, this accumulation method - also known as 'memory ARQ' - will obviously con-

verge even at a low S/N ratio. Furthermore, since shift levels are toggled with every transmission, constant interfering signals within

the receiver passband will not affect the resulting mean value. To prevent accumulation of old request packets, the header is inverted with every new information packet, thus serving as a RQ indicator (similarity test).

10. Listen Mode (Monitor)

This mode resembles Packet Radio monitoring: the receiver scans for valid packets which are detected by CRC match. This 'brute force' method was chosen in order to ensure maximum flexibility, although it consumes a considerable amount of the available CPU capacity.

11. FEC Transmissions

CQ and bulletin transmissions are supported by means of a special non-protocol mode. Packets are transmitted with one or more repetitions; the CS receive gap is omitted. Since the listen mode does not require synchronization, the transmitting station possesses great freedom of selecting packet repetition rate and speed.

12. Practical Aspects

The first PACTOR programs were running on 'breadboarded' Z80 single-board-computers. These early experiments led to the development of a stand-alone 'PACTOR-Controller' with built-in modem and tuning-display. The conventional operating modes BAUDOT and AMTOR were added in order to maintain compatibility and - what might be more interesting - to allow easy comparisons. Assuming typical conditions, PACTOR traffic can be expected to run 4 times faster than over a AMTOR link.

>What should be done to make it compatible?

The addresses that appear on the signature are enough to fool
a _lot_ of people who simply try to use the networks as best
they know how. You yourself know a lot about the routing of email via
packet radio, and thus you know the signficance of the prefix
"packet" before your own personal signature. There are many many
plain ordinary folk to whom this means not a thing - why are they
expected to know how the email is routed, or what network they/you
are on? They see what is clearly an email address (maybe several)
so they fire off email to it. In the end, we pay for the double
hop across the Atlantic, thanks but no thanks if you don't mind.

What to do - simple. Scrap the use of .NA for a packet radio
address, and use something that does not clash with the addressing
scheme of the Internet.

Or did packet radio set a standard before the Internet did? I do
not know the answer, maybe someone can comment with authority.

First, I sincerely apologize to the gentleman from Nambia. I feel
somewhat responsible for his grief with bounced mail to ".NA." .
I just didn't forsee that some folks would mistake packet
radio addresses for internet addresses.

This is *exactly* the problem. Mail was mailed to the wrong
addresses. Neither network malfunctioned.

I humbly submit that screaming at each other that we have
duplicate names in our addressing widgets is *not* going to
solve the problem. How in the world can anyone guarantee that
every network developed from now on will have unique address
widgets? I don't think that's possible.

All mail carried by a gateway should encapsulate the original
addresses. If a "reply" command had been used on either
network, each would have functioned correctly.

Here's what is probably going to be an unpopular suggestion,
but I can see no other way. Shouldn't each network have
a "network name" appended to the address? Someone suggested
something like this with "ampr.org", but that is really
an internet type address with ".org" being the highest-order
address widget. I'm suggesting that *all* internet
addresses would be tagged with ".inet" or some such, and
all packet addresses with ".pckt" or the like. I believe
bitnet already is handled this way ? This, along with
right-to-left scanning by mailer processes, would
guarantee that at least the thing goes out on the right
network. Think of it like variable names within subroutines.
In C, these can be duplicated, as long as they are in different
subroutines, which have unique names.

Flame gear on...

I was on packet for several years until about 1987 or so, after which I moved and never got around to re-mounting a VHF antenna. To that end, I've sort of been out of it for four or so years.

As I remember things then, connectivity between points was still sort of spotty, and the chance of getting a message over great distance without human intervention wasn't always that good.

As I'm about to get back on the air, I'm very interested to know that the "state of packet" is right now. Is 1200 baud still the standard operating speed? Or have things gotten faster? 145.01 was basically "where it was at." Have things broadened a bit w/the increasing traffic?

I'm particularly interested in things like TCP/IP and KISS, though I'm not sure I really understand their current application in Packet. I use machines running TCP/IP all the time on the internet, so I understand the workings of the technology vis-a-vis computers, but I haven't until now followed its development in Packet. Is it something that is still experimental? or is it in common use? I take it that a good number of stations would have to be running it to make it of any useful value?

Thanks in advance...

I have recently acquired an MFJ 1270B and I am discovering a few
things I hadn't read concerning packet setup. I have an ICOM 2AT and
an AT Clone, and so for the TNC talks to the computer just fine,
but...

I have two questions:

1) With the TNC connected to the computer and the radio connected to
the TNC, there is so much RFI from the computer equipment that my HT
doesn't receive a thing (I suspect it's due to a built in AGC
circuit). Using a shielded cable for the TNC<->AT doesn't seem to
help at all. Also, I am using the prefabricated MFJ HT<->TNC cable,
built *specially* for the IC 2AT ;-) . The manual did mention that a
shielded cable is recommended for the TNC<->HT -- do my problems mean
that this cable is not shielded properly? (there goes another $15...)
Any suggestions/recommendations for this problem are very welcome.
But how come on the cover of CQ you see the guys in there decked out
shacks with there computers and TNC's sitting side by side? Is the CPU
in the back of the house? ;-)

2) The MFJ manual explains that to configure the 1270B for digital
loopback mode all you have to is connect JMP10 on the board. Well, I
did that (and set MYCALL to my call), but the TNC timed out sending
packets and never did connect. Is something wrong with my TNC?

Thanks in advance for any suggestions.

John.

The purpose of the continent code is to shorten the routing search.
My BBS knows that all .EU traffic goes one way and doesn't worry about
the country code.

As far as just removing the continent code that doesn't solve anything.
Some other name will conflict.

From another point of view, why does Internet want Nambia as .NA?
Why aren't the countries using their ISO country code?

I think in the long run, we amateurs are going to have to come
to some Internet naming convention that fits all. Hank mentioned
CA.USA.NA.AMPR.ORG but I kinda like CA.USA.NA.AX25BBS.AMPR. Lets
get AMPR as a high level name from the Internet instead of having it
under ORG. Them something like AX25BBS or AX25 (or ???) will
indicate that what follows is routing information. This would
actually allow us to construct gateways based on what area of
the world a gateway wanted to cover. For example, a gateway could
be established for CA.USA.NA.AX25BBS.AMP. SMTP would send mail
to that gateway where it would be translated into AX25 BBS format
and sent via packet radio.

To the purists who hate the idea of domains and hierarchical
addressing mixing, I am sorry but something needs to be done to allow
TCP/IP and the AX25 Non-TCPIP people to successfully integrate their
networks.

I have a MFJ-1274. It's very noisy RFI wise. There is no RFI suppression
on it's board at all. The RFI comes out of any cables you might have
connected to it. Try a torrid on both the radio cable and the power
cable. I used a Radio Shack type clip on choke and wrapped the 2
cables on opposite sides of the choke. Shielded cables might help,
but the case doesn't bond anywhere close to where the cables ground
so I'd be skeptical. The shielded cable on the data cable might be
just serving to get the computers RFI out to the TNC where it can
be reradiated. Oh, of course do the old scrape the paint off the place
where the screws go through the cover so as to ground the cover to
the rest of the case. Remember that you can test for RFI by disconnecting
the suspect cable while listening to the noise on a HT or whatever.
The one cable this doesn't work for is the power cable for obvious
reasons. As a personal note I'm very disapointed with the amount
of RFI my TNC puts out. I'm a computer person that went over to
radio recently. I have various nasty old computers around here that
produce a lot less RFI than my supposedly designed for radio TNC.

If you look at the schematic you'll see why that doesn't work.
Connecting JMP10 means that the output u10-8 has to fight with
the output u20-7. If the output on u20 is stronger you won't
see any data coming back. I found that jumpering JMP7 (analog
loopback) worked just fine for talking to oneself (disconnect the
radio of course).

They are. The Internet domain naming system uses the two-letter ISO
country code. I believe ISO defines both 2- and 3-letter country codes.
From RFC920 ("Domain Requirements"):

      Countries

         The English two letter code (alpha-2) identifying a country
         according the the ISO Standard for "Codes for the
         Representation of Names of Countries" [5].

I'm not familuar with the 1270B, and can't comment on the loopback stuff, but
I have successfully used a IC 2AT with a PK-232 and an XT clone. At first
(while lining in a temporary apartment with an indoor antenna, I had interference
problems such as you describe. This was solved by simply moving the antenna
further from the radio/computer/TNC. Later, set-up in a house with an ourdoor
groundplane, the same problem reappeared. Pkt had been down for a while due
to a bad power supply in the computer. After the PS was replaced, noise!!!
I blamed it on the PS, and gave up on packett untill I decided to replace the
antenna with a homebrew J-Pole - vola packett again. In other words, try
lots of things, but always suspect that the computer and/or the TNC may be
radiating into the antenna.

Now I'm moving into an apartment again, so ---.

Good luck and 73

Sarge - W0RIJ

Since the vast majority of the world seems to insist on a host/domain name of the form "I.AM.HERE.SO.THERE!..." with the incorporated geographical mumbo-jumbo, why isn't it just shortened down to something that won't change for any reason other than the earth being blown to bits. Continents become an irrelevant issue. It won't matter if the national governments are overthrown, decide to change their name, have several prefixes for callsigns, or simply have different name/spellings in other languages, etcetera, etcetera. It would be very easy to determine (geographically) where the distant end is. A computer could even figure out where the destination was in X-Y coordinates with this method. If we ever have large-scale satellite switching, this might make things easier.

Use grid-locators. ;-)

No, I'm not serious.

I would like input from anyone who has experience or opinions on this issue:

I am setting up a packet station and plan to also do satellites in the future.
I don't have a TNC and in shopping, I find that there are several DSP units
on the market.   When I look at the prices of a PK232 plus PSK modems, etc.
it seems that the price of several different pieces of packet equipment
nearly equals what is advertized by the various DSP makers.

So, I'd like to find a single unit that will do it all, but I'm not sure what
is best or if these units really do it all??

  1. There is a DSP-12 from L.L. Grace. $595.
       They claim   400bps PSK
            1200bps PSK
            2400bps packet
            9600bps DFSK

       If you add the extra 1MB of RAM it's $744

  2. There is the Kantronics Data Engine with all 3 modems ~~$700
       They claim 1200 buad AFSK
                  2400 baud QPSK
          and   9600 baud DFSK which is supposedly "UoSAT compatible"

  3. And of course, there's the AEA DSP at $789 or $999

       Which claims all the same things...

Any information or reactions from others that you might have would be
most interesting in helping decide. Looks like I'm going to spend
somewhere between $600 and $800 to for the packet and modems...
Maybe the older PK232 and PSK modems of some sort is best?? I've
read in the AMSAT Journal where there may be problems getting into
and out of KISS mode with the PK232? I'm not sure how real that is...

I've got the benefit of not having any equipment and thus starting from
scratch, but I want to spend that money wisely and get things that work
well and will last for several years without having to spend a more money.

Thanks in advance for any help, experiences, or suggestions you might have.

]so that its addresses do not look like internet addresses.

The simplest one is username (callsign) +separator+hostname, because it's not really domain-based. (e.g. jj1bdx@jh1ynw) The fake domain PRUG is going to use to identify them is username@hostname.fwdnet, because RLI/MSYS sysops in Japan call themselves forming a network called FWD-NET (forward-net).

]Regrettably, the ham packet radio network is not a fully connected
]network, and it uses very small computers which cannot hold or maintain
]large routing tables, so a hierarchical geographical routing scheme is
]really all that's workable right now. Would that it were not so.

Is it really geographical? I think most of RLI/MSYS people are still using bang-style source routing.

This is a VERY GOOD idea. Internet usually uses the 2 letter ISO abbreviation and therefor packet radion can nicely use the 3 letter ISO. You people should however establish a central clearing post that makes sure they use the right one and it is actually not used on the

internet.

I think the 3 letter ISO abbreviation (NAM for NAMibia) would go very
nicely as apposed to the 2 letters used on the internet.

Following is status of Japanese packet radio, representing my points of view as
the domain administrator of prug.or.jp, not necessarily representing views of
other PRUG staff members, nor of RLI/MSYS sysops in Japan. I hope this helps to
find out naming issues that packet radio enthusiasts face now.

First on techcical policy issues:

* prug.or.jp (IP network 133.168) and genesys-p.or.jp (IP network 133.? (sorry
I don't remember, but they have another class-B network) domain administrators
have agreed not to connect to ampr.org sites unless they meet the requirements
of IP network connection (An IP network should have only one gateway to other
IP networks).

* prug.or.jp have a policy that no RLI/MSYS messages should be forwarded into
Japan Internet/JUNET. JUNET does not allow anonymous postings. And the risk
of anonymous postings is very high on RLI/MSYS in Japan. prug.or.jp and
genesys-p.or.jp also prohibits message exchange between their radio sites and
Internet sites outside prug/genesys-p.or.jp.

* Japan has been paying very high cost to maintain Internet connection to the
USA and the rest of the world. If you set up ham radio stations here to use

ampr.org, you have to use an American primary name server for identifying Japanese station. The reason why PRUG established their own domain is to reduce this cost and make things manageable within Japanese Internet community.

* Of course you can choose several other alternatives. ampr.org can contain IP networks other than 44. But I don't want to do this without agreement of Phil Karn, the domain administrator.

Next, the local political issues:

* Many of RLI/MSYS sysops in Japan do not want to forward their messages to those who are using KA9Q. We have long been arguing this issue and we want open bi-directional unrestricted forwarding inside ham radio community, but they disagree, so I have to treat them separately.

* RLI/MSYS people says all persons on the packet radio should use his/her callsign as the username to represent himself. I feel this is absurd, since AX.25 packets ALWAYS contain valid callsign.

* ampr.org subnet coordinator in Japan (who can assign 44.129) does not want to accept application from those who are actually running KA9Q (most of them are running Terakoya news systems), because of different policy. PRUG obtained a legitimate IP network (133.168) and assigning 1/4 of it (133.168.[1-63].*) solely for ham radio use (and WILL NOT ROUTE the datagrams to the existing Internet), to meet high demands from newcomers. genesys-p.or.jp does this too now for Osaka and other Kansai area people.

For conclusion: my opinion is that ham radio is just another media for non-profit hobby use (although I respect pioneers of ham radio). And ham radio people should not form closed society. They should break the barriers of old traditions (that everybody should identify themselves by callsigns[sic], etc.) or they will lose support for local societies. I strongly disagree with idea that ham radio should have closed incompatible naming space.

>From another point of view, why does Internet want Nambia as .NA?
>Why aren't the countries using their ISO country code?

Quite clearly you are not really up to date: The countries ARE using
their ISO country code. If you look up the standard you will see that
there are two the 2 letter and the 3 letter. It is up to the country
to decide which one they want and they usually (even the US :-)-o)
choose the 2 letter one.

And what is even more clear: First come first serve. If you people had
registered NA as your NorthAmerica top level with sri.nic.MIL, they
would have old me so and I would have chosen something else, most
likely the 3 letters NAM.

>I think in the long run, we amateurs are going to have to come
>to some Internet naming convention that fits all. Hank mentioned

No question about this. This is the idea about internet, you go ahead
and register with sri.nic.MIL ANY domaine name that you like as long
as it is not already used and they will in all likelyhood do that.

Nobody is opposed to do this. Actually I personally am very interested
in internet over the radio as we are a developing country with
rudimentary phone services to the rural areas where the majority of

our poplulation live and quite large hospitals without many specialists
are that need to consult with us here in Windhoek where we have first
world conditions more or lesss (for a price :-)-O).

>widgets? I don't think that's possible.

I don't think that we screamed. (NA and .ac.ZA). The point is you
register with sri.nic.MIL and then get a domain name which you can
choose as long as it not confilicts with aleady existing ones.

I concede that the packet net existed prior to NAmibia, but I registered first. If NA had been registered as North America they would have told me and I would have chosen another name. So if the packet radio software ti not so intelligent that it needs the continent to know where the message is to be routed to that is mainly a design flaw but not a political issue. There are only about 160 countries so a databaselookup should not be so difficult. If the three letter ISO abbreviations were used there is no chance of a conflict (after checking with sri.nic.MIL, of course). If the continent is necessary then use four letters.

>All mail carried by a gateway should encapsulate the original
>addresses. If a "reply" command had been used on either
>network, each would have functioned correctly.

True, true, but it doesn't really matter why. Most users are users and not professional networkers. If you stick an internet like looking adress into your signature someone will use it whether you write there packet only or not.

>Here's what is probably going to be an unpopular suggestion,

>network. Think of it like variable names within subroutines.
>In C, these can be duplicated, as long as they are in different
>subroutines, which have unique names.

What for? This is quite unnecessary. Just register a name with sri.nic.MIL as a domine and everything is clear. If you perhaps registered .PACK you can MX each continent's gateway for the shortes possible routing.

I am beeing told by some friends who happen to radio amateurs that this and other problems were forseen and the operators/designers were forewarned and the still choose not to listen. So be it...

Anyway, it has been stopped now. Now I only get the occasional typo for NZ and of course anything in ac.UK that starts with na. (-->uk.ac.*.NA)

Postel:
>... it seems that always expressing the "packet wise" address
>in signature lines and so on as W2XO@W2XO.PA.USA.NA.AMPR.ORG would be a
>practical and pragmatic step that would do much to reduce the
>confusion...

Regrettably, however, if that address were to be used on the packet radio network, which does NOT use RFC822 nor any of the other internet addressing and mailing standards, it would fail.

My suggestion was that the Namibian mailers could rewrite the address W2XO@W2XO.PA.USA.NA as W2XO@W2XO.PA.USA.NA.AMPR.ORG to cause it to use a gateway, should one exist, or else to fail. However, it turns out that they want to avoid the transport of those messages in the first place, which they have achieved by placing dummy wildcard records in the nameserver for *.USA.NA. That has achieved the desired result at much less pain, and since there are no gateways between internet and the ham packet radio network, at no loss of mail connectivity.

That is a hack that works. Some more-or-less correct solutions are to:

1) make it extremely clear in one's signature block that one address is for the internet and the other for the packet radio network - or better yet, append only the address which is appropriate for the network to which the message is sent.

2) change the ham packet radio network (since it's newer and smaller) so that its addresses do not look like internet addresses. The simplest way to do that is to change the routing separator character from the dot

to (for example) the colon. Thus W2XO@W2XO:PA:USA:NA, which does not look at all the same as the internet address that might be adjacent in the sender's signature block, yet retains precisely the same meaning as the dotted ham packet radio address did. The colon is not currently significant in ham packet radio networks, so it is even possible to make the changeover gradually, without a flag day.

Regrettably, the ham packet radio network is not a fully connected network, and it uses very small computers which cannot hold or maintain large routing tables, so a hierarchical geographical routing scheme is really all that's workable right now. Would that it were not so.

I was not aware ham packet BBSes were part of the Internet. Tcp/Ip
operations as "network 44" definintely is, but the PBBS network
is not part of the internet to my knowledge, so don't we have to
make this distinction, that they are a separate entity from the
internet?

>   Hank mentioned

>CA.USA.NA.AMPR.ORG but I kinda like CA.USA.NA.AX25BBS.AMPR.

Yes, "AMPR.ORG" sounds like network 44 to me. I think if PBBSes
are to be part of the internet, then they *must* follow internet
addressing schemes. If they are *not* part of the internet, then
somehow the addresses should have some component at the right-hand
side that *clearly* indicates this.

>get AMPR as a high level name from the Internet instead of having it
>under ORG.

Sounds like this is a vote in favor of putting ham PBBSes on the
Internet. Then you could do something like "PBBS.ORG", which would
differentiate the PBBS network from ham TCP/IP.

>   Them something like AX25BBS or AX25 (or ???) will
>indicate that what follows is routing information.

Uh..now we're back to the original problem, this is the point
at which the addresses "go screwy" by internet standards.

>   This would
>actually allow us to construct gateways based on what area of
>the world a gateway wanted to cover. For example, a gateway could
(stuff deleted)>
>To the purists who hate the idea of domains and hierarchical

I endorse the idea that if we have at top-level domain
name assigned to ham PBBSes, then it doesn't matter at that point
how the rest of the address is used. The fact that it is actually
routing information is not important to the internet hosts that
merely forward to the ham PBBS gateways on the internet. They
know what to do with the rest of the address.

A possible partial solution to TNC RFI is to use a rooftop antenna, and
not a rubber duck on the HT. Also, using seperate power supplies for the
HT, TNC and computer helps some. One other thing: I use a very long (20')
TNC<>radio connection cable in my packet station. Ferrite cores didn't
do a whole lot for me, but may still be worth trying.

I run an ampr.org. site that has one interface to the local amateur radio
community, and one interface to the Internet, with the new encapsulation
methods described in rfc1226 and rfc1241. Would you consider adding a
route from your machines to mine? I seem to meet your requirement.
Perhaps you might also be able to explain why you formed the requirement.

> * Of course you can choose several other alternatives. ampr.org can contain

> closed society. They should break the barriers of old traditions ...

I take it that you are in disagreement with the Japan ampr.org subnet
coordinator. I'm glad, because I can't see how someone can disagree with
an implementation of the Internet protocol suite. To me, it would be
like not connecting to PK-232 TNCs, even though they use standard AX.25.

From an article by rikitake@jrd.dec.com (Kenji Rikitake):
> * RLI/MSYS people says all persons on the packet radio should use his/her
> callsign as the username to represent himself. I feel this is absurd, since
> AX.25 packets ALWAYS contain valid callsign.

I missed this in my first reply. Yes, AX.25 packets always contain valid
callsigns, but not always the callsign of the originating station. For
example, a TCP/IP packet from me to Hawaii will be transmitted there
with the callsign of ah6bw.

This implies that the amateur authorities need to know the IP addresses
of all the amateurs. I think that this is quite all right.

On my home TCP/IP radio station, I use `warren' as my default name,
and `warren', `wkt' and `vk1xwt' to accept mail.

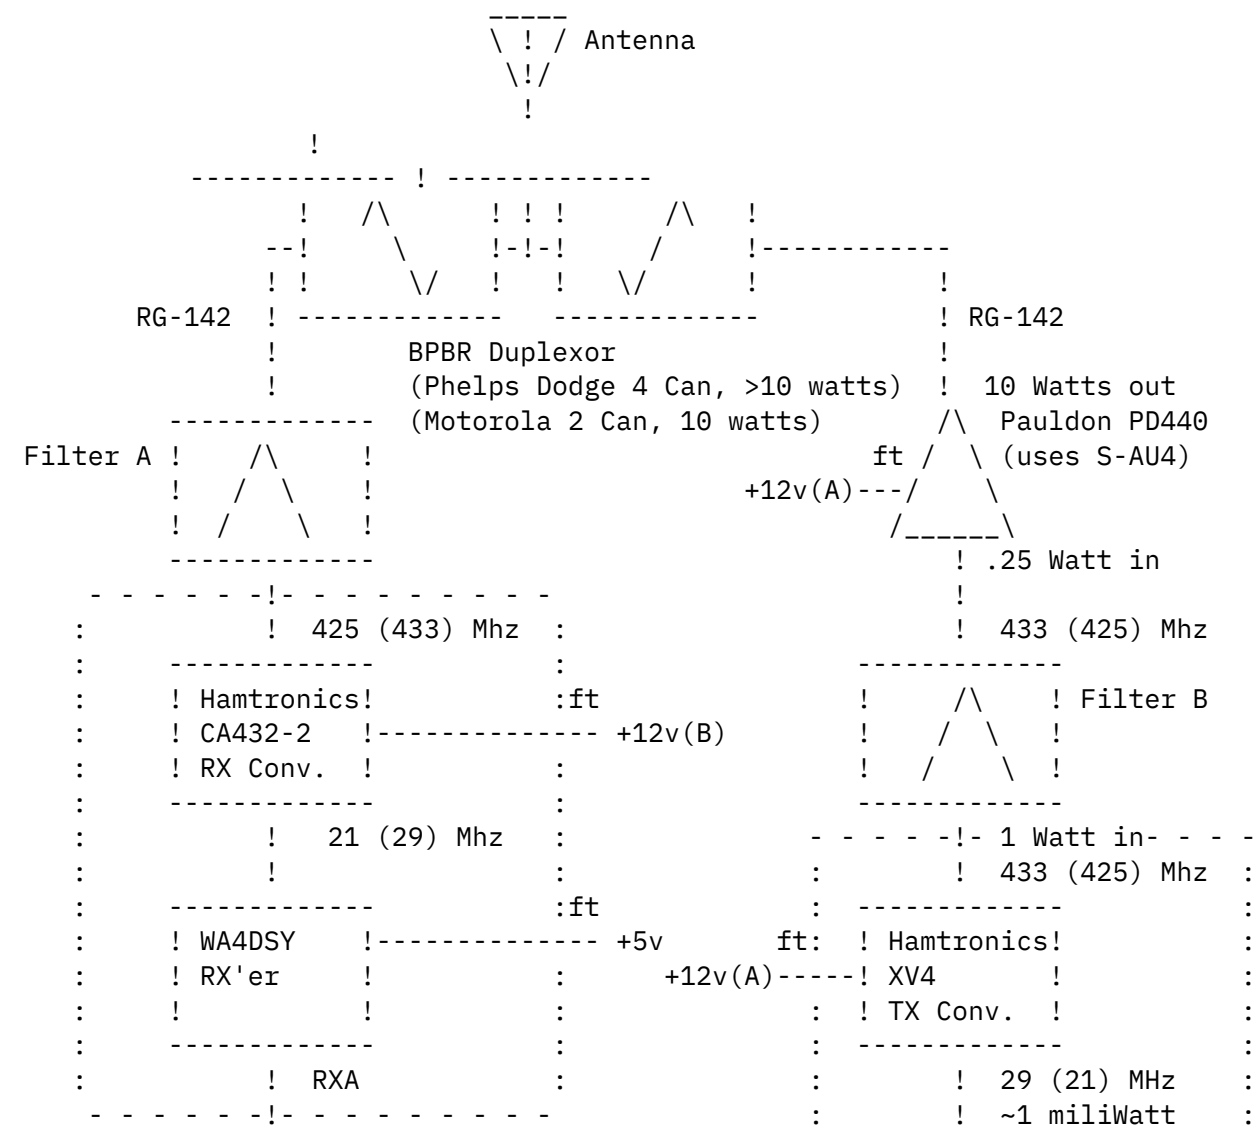
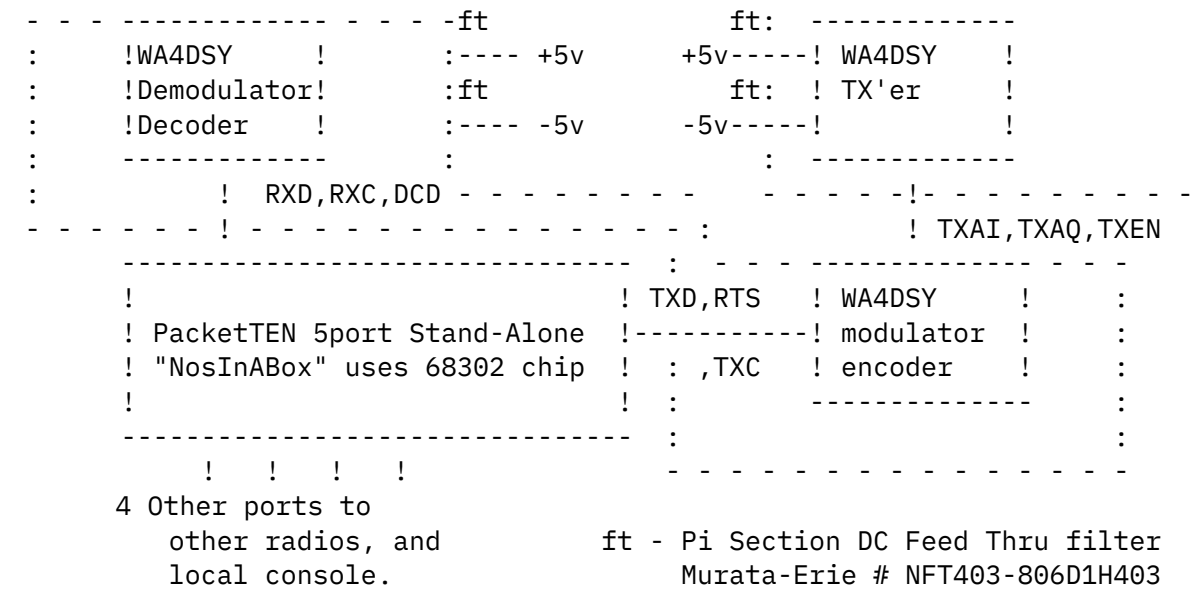
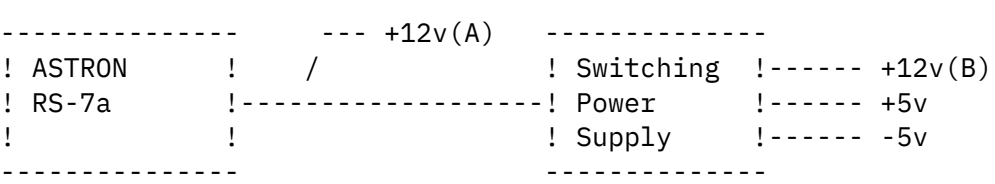
430 Mhz Band Full Duplex 56 KBaud CELLNET Prototype Notes



Donald V. Lemke, WB9MJN
25 July, 1991.



These notes cover the technical details of our two operational 56 KB 430 band full duplex CELLNET prototype stations, using the WA4DSY 56 KBaud RF modem. These stations are operating on a 10 mile test link, with 10 watts, on 425 Mhz and 433 Mhz. Full details of the CELLNET concept are available in the "7 th ARRL Networking Conference Notes", in the article "Celluar Area Coverage Transport Networks" authored by myself. The RF prototypes have been operated at the ILNAP:K9VXW-1 and the N4PCR-1 (Gracilus) sites for nearly 2 years, and have been in active network use since the installation of a Gracilus PacketTEN at the ILNAP site for nearly a year. For the first year of operation, the ILNAP site station was in regenerative mode, simply relaying the transmitted data from the Gracilus site, back to that site, for testing purposes. This test link has been very reliable. During one memorable trip to the ILNAP site, to work on equipment, all links to the site including the telephone were down, except for the 56 KB full duplex link due to iceing conditions, and t/r switching wair and tear.



Utilisation of a single 430 Mhz antenna, and feedline, results in a very economical 3 link radio system, as a result of operating in full duplex. Duplexor Cavities are usually required when operating a station from a high performance RF site, for protection from IMD and nearby lightning strikes. Consequently, split band technigues, such as 220 and 440, are more expensive, since these technigues still require Cavities to be reliable, as well as the added cost of a second feedline and antenna. Multi-banded systems are also more dificult to obtain permission to instal on high performance RF sites.

Besides the extra tower loading of the additional antenna(s), the determination of the interference potentional with the sites primary services is much more complicated. Diplexing 220 and 440 on a single feedline with a compact antenna mounted filter network is tuff to do. I don't believe a 220/440 Mhz nor a 145/220 Mhz diplexers are available commercially. 145/430 diplexors are very common, however. Thus, with diplexing filters, a 2 meter network access station can also easily be accomadated with the same feed-line as the CELLNET transport radio system. If the Japanese, or European versions of the popular dual band antennas were availbale in the U.S., cost would be even less, as a diplexor filter on the antenna end of the feedline would not be neccassary. Allas, the 2 meter / 440 antennas that are available here, do not work very well below 433 Mhz, and pleas to both COMET and DIAMOND antenna companies to supply their home market versions of their popular antennas in the U.S. have either not been understood or rebuffed.

Configuration of 430 band, 56KB CELNET Prototype Stations:

Enclosures - The Hamtronics CA432-2 and WA4DSY Reciever(s) are enclosed in a 9 by 4 by 4 inch Die Cast Aluminum Box, Hammond # The CA432-2 was mounted on the bottom of the box, along with one WA4DSY reciever. There is room for a second reciever to be mounted on the removeable top of the box over the first WA4DSY reciever.

The Hamtronics XV4 and WA4DSY Transmitter are also enclosed in a 9 by 4 by 4 inch Die Cast Aluminum Box, Hammond # seperate from the Reciever Enclosure. XV4 was mounted on the bottom of the box, with the WA4DSY reciever mounted to the removeable top.

The WA4DSY Demodulator/Decoder and Modulator/Encoder are encolsed in a 9 by 7 by 2 inch aluminum chassis, Bud # AC406 with # BPA-1593 bottom plate. A second such chasis, was included to allow for 2 additional WA4DSY Demodulator/Decoder Circuit Boards. The chasis were butted together, and a hole drilled to allow for wiring to pass between them. Shielded DB9 connectors were mounted on the back of the first chasis for the signals to and from the WA4DSY transmitter and reciever.

Switching Power Supply - Radio Shack # 277-1016 (AKA Kogyo # 10053214-2), modified for 12 Volt D.C. input, per RMPRA notes. I.E. change R7 (a 240 Ohm, 1 watt) to 120 Ohm, 1 watt, and R19 (a 910 Ohm) to 470 Ohm. Remove the input Full Wave Bridge rectifier, short the "+" terminal to the terminal that leads to L2 and

the "-" terminal to the terminal that leads to L1. This supply provides plus and minus 5 volts for the WA4DSY modem, and a filtered +12 volts for the Hamtronics CA432-2, with 12 volts D.C. input.

Filter A - 6 Helical Resonator Band Pass Filter. Approximately 4 dB loss. We used the MIXER assembly from a Motorola MOTRAC-Mobile. Similar filters can be found in MOCOM70-Mobiles, and MICOR-Mobiles. The MOTRAC-Mobile has a tube transmitter, making it cheaper to junk for parts. The basic casting is what is of value. We stripped out the mixer diode C.B., and soldered on a BNC connector and lead tapped at the same point as the original input was. The original input was used as the output to the Hamtronics Recieve converter, and the BNC was used to connect to the Duplexor, with double shielded 1/4 inch size coax.

Filter B - 6 Helical Resonator Band Pass Filter. This filter is from the Motorola MICOR-Mobile. It is smaller than Filter A, and has more loss, 6 dB, and a tighter Bandpass response. Its is needed to reduce the linear modulator, and mixer noise floor, which is only about -70 dB out of the XV4. Measurements also indicate that the great majority of the noise is from the WA4DSY Modulator C.B.. THIS FILTER IS AN ABSOLUTE MUST, for full duplex to work. To get it down to 433 and 425 MHz, add about 1 turn to each helical resonator coil of a 450-470 MHz version filter, or buy the 400 to 420 version filter coils. Sorry, don't have the Motorola Part numbers for the coils. Anybody out there know these? Here is a talley of the RF levels to convince you to USE a filter in the transmitter.

```
TX power                                40 dBm
Linear Modulator Noise Floor           -70 dB
Duplexor Isolation (2 Can)             -50 dB
-------------------------------------------
Noise Power ON-RX-CHANNEL W/O Filter -80 dBm  <-Desense!
Filter loss at 8 Mhz Split             -55 dB
-------------------------------------------
Noise Power ON-RX-CHANNEL W/ Filter -135 dBm <-Negligable
                                              Desense.
```

Why is the WA4DSY Modem Linear Modulation anyway?

The WA4DSY modem uses a linear I and Q modulator to achieve true coherently modulated MSK. This modulation is narrower in modulation than non-coherent FSK, with about the same BER rate for Eb/N0 . Also, it meets the FCC Bandwidth rules for data emisions on the 220 and 440 MHz Bands, while doing the legal signalling rate limit of 56 KBaud. This is probably the primary reason for linear I and Q modulation, to meet the bandwidth limitations and still be able to do the legal signalling rate. Thus, we have only a -70 dB modulator noise floor and the the requirement for the TX'er filter when doing Full Duplex with this modulation.

More On Filters:

The TX'er filter isn't a big thing, its easy to modify and tune up, alto it is probably something that those familiar with full duplex radio construction for FM voice are not expecting. Filters such as these are an everyday affair for RF engineers. In recent years exciting improvements have been made in these kind of filters. They made possible the Cellular Telephone revolution. Each Cellular phone has a small ceramic duplexor, which is the equivalent of the Motorola 2 Can BPBR duplexor, in performance. At Dayton in 1991, the Motorola booth had demonstrations of similar 400 Mhz filters that were approximately 1 by 3 by .7 inches! Two of these could do the 433/425 duplexor , and be smaller than the 10 watt RF power amp! One more in the TX strip, and another as the RX preselector filter, and your done.

Looking forward, its not hard to see that FULL DUPLEX book sized 56 KB USER ACCESS stations are a possibility. When Microwave links replace the CELLNET links, way down the road, the 433/425 CELLNET hardware could easily be converted to support users of book sized data stations. How fast do u want your 100 K file, 2 seconds good enuf?!?! Its only RF.

Modification of the WA4DSY RF modem to 21 Mhz band.

The CELLNET prototype stations use Hamtronics recieve and transmit converters to translate the 29 and 21 Mhz WA4DSY modem outputs to 433 and 425 Mhz respectively. Thus, no modifications, or even recrystalling of the Hamtronics transverters was neccassary. Since the WA4DSY RF circuits are somewhat less involved than the Hamtronics Transverter, it was easier to modify the WA4DSY RF circuitry. Since crystals for the WA4DSY modem are not supplied with the kit, and had to be ordered anyway, we ordered the neccassary 21 Mhz crystals straight away. Note: in the CELLNET application, only A transmitter, or THE recievers at a single site are modified, but not BOTH the transmitters, and the recievers.

Modification of the WA4DSY Data Radio for 21 Mhz Operation:

Reciever Modifications:

Change Componants as follows:

C1 - 300 pF
C2 - 47 pF
C4 - 10 pF
C5 - 51 pF

L1 - 1.33 uH (TOKO # BTKANS-9449HM, Digikey stock # TK1412)

Transmitter Modifications:

Change Componants as follows:

C28 - 100 pF
C29 - 200 pF (Parallell 150 with 50)

C35,39 - 43 pF
C48 - 130 pF
L13,L14 - .29 uH (TOKO # BTKXNS-T1047Z , Digikey stock # TK1406)

C41 - 30 pF
C42 - 300 pF
L10 - 1.33 uH (TOKO # BTKANS-9449HM , Digikey stock # TK1412)

Retune per WA4DSY instructions. Its easier if both a Transmiter and a Reciever are modified at the same time.

Observed Performance:

The two test radios have consistantly resulted in good BER performance. The PacketTEN NOS has a monitoring facilities which indicates the number of frames recieved, and the number of those frames in error. With this facility we have monitored the the 56 KB Full Duplex links psuedo BER. As the BER's of the link are so good, always observed to be in better than 5e-5, its a safe assumption that the psuedo BER is very close to the actual BER. On average the link puts in a 1e-5 BER. As stated above its never been observed to have worse than 5e-5 BER and at times its as good as 1e-6. The 10 mile path is a slightly sub-grazing path, with a 100 foot high 6 dBd antenna at one end, and a 50 foot high 10 dBd antenna at the other. Significant foiliage blokage is present on the 50 foot high end. The path is not flat terrain, but includes a river valley, and ridge line at least 50 foot higher than ground level at the 50 foot high antenna end. Overall, this is a good path to test over, with many real world path variations. The Gracilus end of the link is close to downtown Aurora,IL, which seems to be a very intense RF enviorment. The police station is nearby, with a communications tower, and many antennas. There are several FM broadcast stations in downtown Aurora, and apparently allot of paging transmitters. 2 meter hts can not be operated, even in the basement, and on a rubber ducky antenna without the familiar paging IMD breaking squelch. Significant reduction in BER was observed when the above mentioned ICE storm caused the 10 dBd antenna at the Gracilus site to sag at a 30 degree down-angle. Previous to that time, the link was regurlarily doing 1e-6, and afterwards only occaisionally. The reported average performance, tho, includes the performance with the damaged antenna, since to date it has not been repaired.

The reported performance is in line with prediction equations in the "7th Computer Networking Conference Notes". First let me mention that the equation on page 125 for Reciever Noise Power begins 198.6, when in actuality it should have begun -198.6. The tables calculated used the correct equation. 4 dB Noise Figure was not atainable with this hardware prototype, due to additional reciever preselector loss, and larger CA432-2 Noise Figure than assumed for the estimation of 4 dB. The actual Noise Figure of the

prototype recievers was approximately 6 to 8 dB, depending on individual preselector variation, and the larger CA432-2 Noise Figure. Additionally, the test path used has an unknown path loss, due to its variability. The combined impact of these effects, easily accounts for the observed BER's. I approximate a 30 mile truely grazing path link using this same hardware would have a 7.5 dB worse performance, which would be about 4 e-5 average BER, or about a 14 dB margin over 10e-3. In otherwords, the link would successfully send 1000 byte packets between 90 and 95 % of the time.

You are right. Let me comment in this way; it is only the gov't authorities who wants to know where an datagram is coming from. All they need to identify the source of the datagram is the callsign of relaying station. And the operator of relaying station is responsible for some extent (not solely) for contents what the station transmits.

]This implies that the amateur authorities need to know the IP addresses
]of all the amateurs. I think that this is quite all right.

No problem on this, although I don't want to register my IP addresses to the gov't database - it takes too much time to be authorized.

In article <1991Jul30.094448.9044@cc.curtin.edu.au>, I foolishly said:
>   In case you missed it, if you enter 'sb rhubarb@xxx', your bulletin goes
> to the Great Bit Bucket In The Sky (at least it does on an MBL system: I assume
> the others are no better). You have to enter 'sb rhubarb@xxx $' if you expect
> it to leave your own BBS.

   Several people have pointed out that this only happens with MBL software.
They're probably right: my local BBS is an MBL system (whose sysop hasn't
got around to changing), and it gets a bit messy trying to send stuff from any
others (I'd need to go through a digipeater, and I get sick of waiting).
I naturally assumed they were all like that! (No wonder I got irate).
Apologies to all concerned.

   The point was, however, that there seems to be a strong tendency to get
the users to do strange things in order to overcome bugs/deficiencies in the
software. (I'm willing to bet that a lot of the fossils are still typing the
'$' when they want to send a bulletin, long after the system has changed from
an MBL system to something else.) I suspect part of the problem is that
somebody gets a bright idea for his/her BBS program, doesn't think it through,
(and ABOVE ALL doesn't discuss it with some of the other BBS authors), then
we get stuck with the results for a couple of years till it all blows away.
Surely we can do better than this? We are, after all, supposed to be in the
communications business.

   Currently the problem is that packet radio addresses look like Internet
addresses, and I wouldn't blame some poor sod who didn't know the difference
for sending mail to Outer Slobbovia by mistake. (Somebody, of course, had to
claim that a packet address isn't an address after all: apparently it's a
routing hint. All I can say is that if it looks like a duck and quacks like a
duck, then I'm forced to assume it's a duck. Especially when all my local
sysops tell me that mail out of the local area don't go nowhere without it).
I think I'd agree with the poster who suggested that changing the separator
from '.' to something else would be a good start.

.....Ron

Hello friends !

I restored e-mail activity after war and vacations.

.NA discussion triggered me. I allways think that packet radio is
HAM radio first, and digital communications second. Herewith I would
like to rise question on the packet radio history:

Why was strange, unknown, non-HAM standard chosen for addresses ?
We have all grown up with HAM calls, HAM prefixes. I used YU for
Yugoslavia since my first QSO back in 1973, and W/K for USA. All
hams know this system, etc.

Then somebody decided this system is boring, and picked up another
standard list... Now, NA is Namibia and YUG is Yugslavia and we
have confusion. BBS mail is directed @YU and not @YUG, I guess only
some 5% of YU packeteers heard of .YUG ... And it is .DEU and not
.DL... Some countries picked one system, some another. I allways
send mail to @HA and not @HUN; @OE and not @AUS - but @ITA and not @I.
Anyhow, some BBS sysops can handle both systems, some of them would
never learn how to run BBS, others are inbetween. Most used paths work,
obscure are hadled by sysops manually etc.

And there are still some more standards to rise confusion. How about
using car registrations list ? This is standard also, and ALL europeans
are quite used to it. In fact, children are rised up with this standard,
I knew D means Germany long before I ever heard of ham-radio.
[maybe foreign cars are not common in US and other parts, but I saw at
least two while going to QRL this morning].

Now... how about independent Slovenia ?
SL is Sweeden in one code; Siera Leone in another,
South Luckyville in another...

Yes, of course, authorities would find an solution. My proposal was to
devide YU,YT,YZ,4N and 4O prefixes, so some YT or YZ would mean Slovenia.
[why should we use new codes, like S1 for Slovenia and H1 for Croatia ?
 Thus, one small country would grab all 5 nice prefixes of former YU]
You can already see SLO on cars. And so on.

Sigh. Maybe those picking .YUG, .HUN, .NA never heard of prefixes and
HAM calls ??

And before there is a stream of hate mail, please do not take me too
seriously. This is 80% joke.

good luck, peace to everybody !

1. Think you miss the point. That address would be used on internet.
The gateway from internet to bbsnet (gotta call it something!)
would strip the '.ampr.org' when it did the transfer.

2. The bbsnet does indeed use rfc-822 addressing. It simply is not
visible to most folks. It is indeed used for all (that I'm aware of)
inter-network transfers via gateways. It is at the gateway that
the network addresses must be resolved.

3. There is no chance that the bbsnet will change it's address grammar.
Again, it is the responsibility of the gateway to properly translate
addresses, if required. Note that this is already quite common within
usenet - there are internet forms, arpa forms, et al.

4. The real problem is that there are multiple domains, and the existing
software (and the existing 'standards') do not address that fact. Some
domains are orthogonal to others: the 'ampr.org' example shows that.
i.e. there are organizational hierarchies, network connectivity hierarchies
(remember 'An address is not a route'?), and geopolitical hierarchies.
To address all three of the above hierarchies requires three addresses.
Note also my use of quotes around 'standards'. There are few actual
standards in networking addresses. There are some 'requests for comment',
some de facto standards, and a (very few!) actual standards. The ISO country
naming comes to mind as an 'actual standard' ... I don't have the ISO number
handy ...

So we have this problem ... users mostly don't understand much of the
above. My suggestion is the same as yours: education. No matter
what we do with the software, users will make mistakes. I'm trying to
get more involved here on usenet because I'll probably write more software ...

Would *MUCH* rather carry on this discussion via bbsnet ... then the
audience would be much wider.

... Hank

p.s. would you distribute this (or any other comments) wherever you
see fit? I don't have access to distribution lists of interested
parties ...

The country-set of Europe may be small, but not always easy to define;
at the moment it is subject to change......!
Are there ISO country-codes for Latvia, Lithuania, Estonia, Serbia, Croatia...?
Maybe the hams in 'new' European countries will at least get to choose/use
confusion-minimising country-codes.

>>3. There is no chance that the bbsnet will change it's address grammar.

If FWD-NET (that's what we're saying in Japan for "bbsnet") does not change the
address scheme, it's getting harder to gateway the two networks.

>Amateur radio does not stand alone, and
>you can not pretend that the decisions you make (e.g. re: geographic
>routing) are irrelevant to the outside world, because users "should know"
>the difference.

I have nothing personal against Hank Oredson, so the following paragraph has no
intention to insult him. I just want to express my general feelings on people
who are using FWD-NET.

All I can say on this issue is: Leave those who want to self-indulge in the
close world of ham radio. Leave them alone because they don't care they are
getting behind.

I don't want to get behind. And PRUG people around me do not want to get
incompatible with Internet either. And PRUGNET wants to get connected with
FWD-NET if they allow (They do NOT). :-< *sigh*

>Well, just what are YOU going to do about educating YOUR users to not use
>bbsnet addresses on Internet?

I think Hank is not solely responsible on this issue. So don't blame him alone.

My opinion is: if you want to introduce geographical routing, don't put it in

your address explicitly. All you need on to identify a person on FWD-NET is user@host, both user and host are callsigns.

Actually, Hank, it is YOU who miss the point. The problem is NOT the gateway function, it is that bbsnet has deliberately adopted an address syntax that will often "work" on internet, albeit incorrectly. This, coupled with naive users, can and does lead to mail sent to, e.g. Namibia. Now, no one would give a hoot about this except that it is costing the Namibians real $$ money to receive and bounce (or ignore the mail).

>3. There is no chance that the bbsnet will change it's address grammar.

Thanks for your cooperation. That's what makes Amateur Radio great. You're the one primarily responsible for relegating amateur radio protocols to the lowest possible levels that a 512K PC-XT can support -- and be damned with the rest of the world. Amateur radio does not stand alone, and you can not pretend that the decisions you make (e.g. re: geographic routing) are irrelevant to the outside world, because users "should know" the difference.

A 9600 baud packet modem that is serially interfaced should be run at 19.2 kb
and this can create a heavy interrupt load. A 16550a uart can help but I
don't think current versions of PG and PB make use of its FIFO buffer.

I'm leaning toward the TAPR DSP board since it is mounted inside a PC and
interfaces to the XT or AT bus. No more serial port bottlenecks. Instead
we'll have software interface problems ;-)

Within the context of hostnames specified in accordance with internet specifications, "wb6ymh.ampr.org" might be a domain, a hostname, or both. If it is a hostname, there is a mapping from it to one or more IP address(es) and/or mail exchangers. It might also be a domain name, with mail exchanger(s) for it, and/or hosts specified within it. It is the custom for AMPRNET (that's the ham tcp/ip network, to give it a name) to have only callsigns for the host-level domain/host. Thus we have "wb6cyt.ampr.org" and "pc.wb6cyt.ampr.org" as possible host/domain names.

However, in the ham packet radio BBS world, hostnames are simply callsigns (with optional SSIDs). Thus a mailbox specification is "W0RLI@W0RLI", or "wb6cyt@wb6ymh-2". That's because the word on the right side of the "@" is always a ham radio callsign, and they are unique worldwide.

What confuses things is that it is possible to include routing information to be used as default routing hints in an address by placing a dot followed by successively-larger enclosing geographical regions, each separated by dots. Thus we can have "WB6CYT@WB6YMH.#SOCA.CA.USA.NA", which specifies that there is a mailbox on host WB6YMH, in the SOuthern CAlifornia region of CAlifornia of the USA of North America. (The "#" prefix to the SOCA indicates that it is an unregistered local subregional routing designator that may not be unique. This is because the address scan takes place from narrow to large piecewise, fer cripessake.)

A BBS in the ham packet radio network is free to ignore any of the routing information found after a dot on the right-hand side of the @ if it wishes - typically if it has direct knowledge of a way to get mail directly to the addressed host.

Thus you see "addresses" that on the surface appear to be syntactically identical, but have entirely different semantics on the two networks.

The internet probably can't change (too big), and others have rather stubbornly stated that the ham packet radio "BBSNET" won't.

This is separate from the issue of gatewaying mail between the two networks. Ignoring for the moment issues of archaic 18th-century government telco monopoly protection, gateways can handle it rather easily, in fact, by annexing any BBSNET traffic return addresses into the ampr.org internet domain, discarding routing hints in the process, yielding something like "wb6cyt@wb6ymh.ampr.org" as the return address as seen on the internet side of the gateway. On the BBSNET side of the

gateway, internet addresses would simply appear as "BRIAN@UCSD.EDU.IN",
and the BBSNET people would have a single routing entry from their host
to their internet gateway for "*.IN". That's not complicated.

The gateway from BBSNET to internet could dynamically build a BBSNET
routing table from the routing hints supplied by mail passing through
the gateway; for example, mail from "wb6cyt@wb6ymh.#soca.ca.usa.na"
would become "wb6cyt@wb6ymh.ampr.org" as it left the gateway into the
internet, and the gateway would have built a routing table entry that
listed the routing hints for the "wb6ymh" BBSNET host as
"#soca.ca.usa.na". Cooperating gateways might even arrange to
periodically share this info; I can think of a nifty way to do it with
DNS TXT RRs. Of course the AMPR.ORG nameserver would have to be updated
with this info too.

I hope this clears up some of the muddle about what's happening on the
two networks. It is essential to understand that we are dealing with
two completely separate networks with completely separate methods of
transport and routing. It's only because the addressing LOOKS the same
that the problem occured in the first place.

Why is it that you believe that `bbsnet' should use an address syntax that
works with internet? I don't expect to be able to send a message to someone
by using their telephone number as the address. If I wanted to connect my
BBS in to another network, I'd expect to have to resolve any addressing
problems at the gateway. I wouldn't have thought it would be too difficult
for the bbsnet<->internet gateways to understand the differences between the
two networks and make address changes as necessary.

Here you use an important word - `amateur'. By far the majority of people
using packet radio ARE using cheap computers, often far more basic than a
512K PC-XT. There are many reasons for this, not least amongst them is that
the equipment is cheap (often all that they can afford). If we were to start
dropping AX-25 then we would be depriving a lot of people of a lot of
pleasure.

We owe a lot to Hank, and others like him, who have put a lot of effort into
coming up with an AMATEUR RADIO system that works. Yes, with hindsight, a
lot of things could have been done better, but then again that could be said
about everything.

  OK, by the same token, all other mail systems in the world, if they want to gateway into the Internet, must change their addressing scheme to match the Internet?? N.F.W.!!!! As a W0RLI BBS op for many years, I can say that traffic went very well all over the globe, thank you, WITHOUT the "benefit" of the Internet. Hank did a damn fine job with his stuff. It worked.
To change the whole BBSnet to a "compatible" addressing scheme would mean that all of the BBSes, simultaneously, would have to change to the new code.
Get real! It'll never happen. And, why should it?

  What is needed is gateways that are intelligent enough to do the address translation properly. I suspect that the reason the Nambians are getting mail wrongly is NOT because the BBSnet addressing scheme is "wrong", but because some gateway somewhere screwed up.

  Remember, most of the code in human-interactive programs deals with error conditions. Those poor bits of silicon are trying to cope with us humans.

  Make the gateways robust enough to tell the difference and the problem will dissolve.   At the least, they should err on the safe side if they are not sure of the translation. At the very least, users should be able to do wb5bbw%wb5bbw.TX.USA.NA@gateway.schmidlap.goshwatta.edu....

  As to what Hank is doing: He said he's getting more involved , isn't he?
Give the man a chance! Illegitimi noncarborundum, Hank!

First, let me apologize for the strident tone of my last posting. I really
have nothing personal against Hank, and I am even one to appreciate all he
has done for the amateur BBS community.

However, there are some folks out there who just do not understand the issue.
for example:

kurt@neuron.cs.tamu.edu (Kurt Freiberger) writes:

> OK, by the same token, all other mail systems in the world, if they want to
>gateway into the Internet, must change their addressing scheme to match the
>Internet?? N.F.W.!!!! As a W0RLI BBS op for many years, I can say that
>traffic went very well all over the globe, thank you, WITHOUT the "benefit"
>of the Internet. Hank did a damn fine job with his stuff. It worked.
>To change the whole BBSnet to a "compatible" addressing scheme would mean
>that all of the BBSes, simultaneously, would have to change to the new code.
>Get real! It'll never happen. And, why should it?

I *DID NOT SAY* that the BBS adressing scheme should be compatible with
Internet. In fact, what I *DID* say was that the BBS addressing scheme
should *NOT* be compatible with the internet -- in the sense that a BBS
address, if inadvertently used to address a piece of mail on the Internet
(by a confused or naive user) should *NOT* accidently route to places like
Namibia, that cost real money to unsuspecting end users (in Namibia) who
have no desire to play amateur radio games.

Once again: this is *NOT* a gateway issue. Gateways can do (almost) anything.
This is a *USER CONFUSION* issue, where a user uses the wrong address for
the network he is on. It is akin to the UK folks writing their addresses

backwards. No one cares, in general, if a few pieces of mail get bounced.
However, this confusion is costing real people real money.

The BBS folks deliberately ignored the pleas of the Internet folk to adopt
a different address syntax when geographic "routing hints" were first
adopted. Because of this, I think the BBS folks have the primary
responsibility to alleviate the confusion. If you don't, even the gateways
will be denied to you (cf: the Japanese FWD-NET).

  I was under the impression that the offending BBSNet addresses got to the
Internet via a brain-damaged gateway. It seems that this is not so. If
the messages were sent by someone on the Internet that didn't know better, the
BBSNet isn't at fault. It's a learning process that will take time and
unfortunately money. Sorry, Nambia, but you knew the job was dangerous
when you took it.

System IDentifier (SID)

The initial exchange between "smart" MailBox systems uses what is called an "SID", short for System IDentifier. All future work on MailBox systems should adopt this standard. It will help to remove a GREAT deal of confusion as to which systems have what features, and how one should interface to them. In the longer future, perhaps all this junk can be done away with, and the computers can talk to each other in a more natural way.

The system identifier is structured:

"[f1-f2-f3]"

The dashes delimit the end of the first field and the start of the last. There might be only one dash, if f2 is void. f2 may contain dashes.

f1, f2, and f3 may not contain "[" or "]".

f1 is the author identification. It may not contain a dash.
Normally it will contain a few characters from the authors callsign.

f2 is author specific data.
It may contain anything the author wishes, for example software version.
It may contain dashes.

f3 is the supported feature set. It may not contain a dash.
It contains a string of non-numeric characters, one for each negotiable feature supported. Each character may also have trailing digits, giving the revision of that feature. If there is no trailing digit, the feature revision is revision zero.

Defined features are:

C - Supports "forwarding" of date and time (obsolete).
H - Supports hierarchical location identifiers.
M - Supports message identifiers.
R - Supports extended forwarding responses.

Y - Supports YAPP binary protocol (unused).
$ - Supports BID. MUST BE LAST CHARACTER IN f3 for downward compatibility.

The existance of the system ID implies that the system supports
reverse forwarding and OK/NO message rejection.

Some examples of existing standard system identifiers:

[RLI-12.0-H$]   - w0rli version 12.0, supports BID and H location.
[CBBS-5.1-$]   - ag3f release of the rli/gyq cbbs.
[MSYS-1.11-H$]   - wa8bxn version 1.11, supports BID and H location.
[MBL-5.14-H$]   - wa7mbl V5.12, supports BID and H location.
[4RE-2.3-MH$]   - aa4re V2.3, supports MID, BID, and H location.

The connect rules:

Send the SID as first line at connect.
Answer the SID (when seen as a command) with a short command prompt.

The forwarding rules:

If you do not see an SID at connect, use the old style fowarding.
This handles the case of Xerox 820 systems, for example.

If you do see an SID at connect, answer with your SID.
Use whatever features are appropriate.

The message entry command:

Sx TO [@ BBS[.LOC]] [< FROM] [$[BID]]

x may be B, T, or P.
If x is absent, P is assumed if TO is a callsign, otherwise B is assumed.
The $ is not part of the BID, but identifies the field.
There is no space between the "$" and the BID. If only the "$" is present,
a system generated unique BID will be supplied.
The spaces surrounding the @ may be omitted.

OK/NO message rejection.

Instead of sending the "S" command and Title, send only the "S" command.
The remote system will reply with either OK or NO, possibly followed by
some text. If the response is NO, it will be followed by a prompt.

If the response is OK, then go ahead and forward the message. Usually,
NO will only be seen if you attempt to forward a message with BID already
known to the receiving system. It may also be seen in the case of full disk,
or any other reason the receiving system does not want the message.
Possiblities under discusion range from "I do not handle NTS traffic." to
"I do not know that user, nor any route to reach him."

Note that only the "N" or "O" are required.

There is a "BID" (Bulletin IDentifier) associated with each bulletin
type message and with any message which has a distribution list.

If a BID is not given explicitly with the "Send" command, one is
created automatically from the message number and callsign of the MailBox
into which the message was initially entered. It has the form nnn_call.

There are 3 types of messages:

1) Personal. If sent with SP, or with S and to a callsign.

2) NTS traffic. If sent with ST.

3) Bulletins. If sent with SB, or with S and NOT to a callsign.

For Bulletins, a BID is ALWAYS associated with the message, and is sent when forwarding to systems that indicate in their SID that they accept BIDs.

For Personal, the message can only be read by the sender, addressee, and sysop.

There are several "flags" associated with each message. These are shown in the "message status" position in the "list message" display. Note that each flag has an associated "L" command, and some have associated "K" commands.

F - The "Forwarded" flag:

    This indicates the message has been forwarded to all
    its destinations, but has not yet been killed.

H - The "Hold" flag:

    This indicates the message is held.
    It will not forward, and can only be seen by the sysop.

I - The "In process" flag:

    This indicates the message is in the process of being forwarded.

K - The "Killed" flag:

    This indicates the message is killed, but has not yet been purged
    from the system. Killed messages are purged with the GM command.

O - The "Old" flag:

    This indicates the message has been hanging around
    un-forwarded and un-read for too long.

Y - The "Read" flag:

    This indicates the message has been read by its addressee,
    but has not yet been killed.

How do BID's work?

The various commands (S, M, CM) work in exactly the same way.
The basic command is S[type] TO [@ AT[.LOC]] [< FROM] [$[BID]]
Data inside [] may be omitted.

Messages differ in the following ways:

TO may be translated.
TO is a callsign.
TO is an interest group.

AT may be translated.
AT is a callsign.
AT is a distribution list.
$ field is present.
$ field is present, with BID.
Type is B
Type is P
Type is T
Type was not specified.
Message is held.

A type B or P message gets a BID if the command that creates the message has the "$" field. A message of type B gets a default BID if none was specified. A message of type P gets a default BID if none was specified and it has a distribution list. A message of type T never gets a BID. In the discussion below, the same rules apply whether the message was created using the S, M, or CM commands.

Here is how the system behaves:

1) If the user sends the message with "$ID" given in the command, the message is assigned identifier "ID". If this identifier has been seen before, the message is rejected and the text "NO - Duplicate BID" is displayed.

2) If the user sends the message with "$" given in the command, the message is assigned a unique MailBox generated BID. This BID is generated from the message number and callsign of the MailBox. The message is accepted, since this BID cannot have been seen before.

3) If there is a distribution list, and a BID is not given with the command, a unique MailBox generated BID is assigned. This BID is generated from the message number and callsign of the MailBox OF ORIGIN. If this BID has been seen before, the message is put on hold.

5) If a message is received from another MailBox, and has a BID sent along with it, and has a distribution list that includes the MailBox from which the message was received, the message is marked as already forwarded to that MailBox.

Some results of applying these rules:

1) A message entered into the system without using "$" in the command and without a distribution list may loop within the network. These messages are held after they have passed through the system

a small number of times, normally two.

2) A message which was entered with a "$" given in the command
   will be rejected when it is forwarded back to any system it
   previously passed through.

3) Messages of type B or P may have a distribution list,
   messages of type T may not.

4) There will be no attempt to pass a message which has a BID
   back to the station that sent it to you.

Just wondering what ISA bus cards currently exist or are being worked on...
that have a processor on board to handle buffering, interrupt service
and host transfers for a couple 8530s ? Is anyone working on something
like this? I envision possibly a Z80 or Z180, a couple 8530s, and some
RAM.. the thing would have soft firmware that would be downloaded by
the host at initialization time. It would transfer packets to the host
through a parallel channel (either i/o mapped or shared memory) and
only interrupt the host when an entire packet is available rather than
for every single byte (!).

Does this describe a DRSI card? I know nothing about them...

Does anyone have a copy of the FCC Rules handy? I need to know the permissible data rates on the VHF/UHF bands (50 MHz and above). I had them around here somewhere but misplaced them.

Do the rules state or does anyone know of any standards (suggested by coordinating bodies, etc) for sidelobe levels/adjacent channel protection ratio, etc?

Thanks in advance,

Hello to all:

I just got into packet a few months ago after I found NET/Mac on the internet. TCP is great over the radio (I did have to learn ax25, too!)

but I would like to go faster than 1200 baud. Since I'm not too adept
at modifying tranceivers and I haven't seen any high-speed packet cards
for my Mac I was looking at the Kantronics Data Engine/DVR2-2 combo
with a 9600 baud modem in the Data Engine. Has anybody had any experience
with either of these machines? I'm also worried about whether this modem
will exchange data with another 9600 baud modem of a different type. Is
9600 baud *9600 baud*??? What about upgrade paths for higher speed modems?

Thanks in advance..........

jan.

Lines: 78

I have had so many inquiries about how my gateway works that I thought
it time to post an explanation here.

The gateway is part of my packet PBBS for Unix. The PBBS is several
years old now and is up to version 3.96 at present. It is a full-blown
PBBS and does all the usual stuff like Forwarding and Reverse
Forwarding and Hierarchial addresses, etc. However, since it runs
under Unix, it is able to efficiently handle multiple users and
also allow local access and file manipulation using the normal
unix tools. For instance, forwarding and mail beacons are
initiated using cron and mail is kept as a normal unix ascii
file so that it can be handled by more, cp, head, tail, etc.

The bbs runs as a child process of KA9Qs 'net'. I am using
a very old version because I haven't yet had the opportunity
to put the IPC communications stuff into NOS. As a matter of fact,
I had planned, rather, to go the route of an AX25 driver for
unix to handle packet radio using the built-in Berkely networking

stuff in unix instead of modifying NOS. Anyway, at the moment,
its 890421.1A (N3CVL Unix Test version) with my IPC code. There
are two ax25 calls specified, one for the PBBS and one for the
normal 'net' stuff. When someone does an AX25 connect to the
bbs call (W2XO-0 in my case), 'net' spawns an instance of XOBBS
and sets up IPC using Sys V message queues (which are also available
in Ultrix and some other Unix versions). Netrom and TCP/IP packets
are handled at the other call, (in my case, W2XO-1).

The gateway is pretty simple with this setup. A 'daemon' program
(xoscanmail) scans the mailbox "/usr/spool/mail/bbs", parsing
the mail found there into the format I use internally in the
bbs mail spooling directories and places the mail in ~bbs/temp.
All mail incoming from any of the PBBSs also gets put into
~bbs/temp. Now, another 'daemon' (domail), goes scans this
mail, checking it against several files, including "usenet.dst",
"fwd.xo", "hadr",and "dist". "Usenet.dst" contains the call letters
of every known ham with an internet address. If "domail" finds
a match between the "To" field of the packet mail and the
"usenet.dst" file, it then just hands the message off to
the regular unix mailer (Sendmail in my case), and away it
goes out the internet, using a second set of aliases in /etc/aliases.
If no match is found in "usenet.dst", then a search is made of
"dist", which is a list of the packet distribution lists like
"ALLUS" and etc. If a match is found between the "@bbs" field and
a line in "dist", then the mail is sent to a suitable packet
PBBS for forwarding to the packet PBBS network. If neither of
these pan out, then a check is made for hierarchial addresses in
"hadr" and finally the "fwd.xo" file is looked at, which is a database
of known packet bbses for forwarding. Mail known to be local is
then movded to ~bbs/mail and mail to be forwarded is moved to
~bbs/fwding. Normal instances of the bbs read mail from ~bbs/mail and
a special instance of the bbs (the forwarder) reads the stuff in
~bbs/fwding and sends it out on the packet network.

So, that is basically how the gateway (and the bbs) work, for those
that asked (aren't you sorry you asked?). 8-) .

There is also a function in the bbs to read netnews (suitably
scanned for no-no's). Another plus of Unix.

Sorry to be longwinded, but I guess there was enough interest
to warrant using a little bandwidth here to explain.

If you want a copy of the code (bugs are free also), it is
on "vax.cs.pitt.edu" in the pub/ka9q directory for anonymous
ftp. The version there may be a little stale, since I don't
have but a 2400 baud link to cs.pitt.edu and it's tedious to
keep updating and I'm lazy. 8-). You will need both the
modified KA9Q 'net' and the bbs. The file names are net.xo.tar.Z
and xobbs39.tar.Z .

There are a few people running the code , but it is tricky

to compile on the PC versions of Unix and not that many folks
have unix boxes at home ! Don Bennett (K4NGC@K4NGC.VA.USA.NOAM)
has it running on a PC.

Hope this is helpful..

Jim Durham, W2XO

Could someone with a copy of the FCC Amateur Rules let me know what the
maximum permissible data rates are on the bands above 220 MHz? Also, what
are the stated rules for sidelobe containment on the bands above 220 MHz?
If there is no rule for some bands are there suggested channel spacings or
minimum sidelobe suppression levels on some of those bands?

Please e-mail responses....looks like it's time to pick up a copy of the rules
again...

I have a PK-232MBX with up to date firmware and drive it
from a IBM-PC running the recent (last 3 months) revision
of PC Pakratt. I have noticed that while receiving packets,
if I hit the "End" key to show what other users have been
heard (I think it invokes Mheard while in host mode) that
the packets I am sending appear to be sent with different
mark and space frequencies only while the screen showing
stations heard is up.

Am I crazy? Has anyone else noticed this? It's hard for
me to imagine that PC software could do that unless its
changing to the HF shift at the same time it is doing the
Mheard.

I'll get version numbers of the stuff if anyone has time
to verify what I am seeing on their system.

I recently (5 days ago) got my technician ticket in the mail. 8-)

I am very interested in getting into packet and I would like some suggestions
on a TNC.

Questions I have are:
- What about 2400bps models? Do enough people have them that it is
  worth it to get 2400?
- I am interested in getting a model for the least amount of money possible.
  Any recommendations on what I could get?

Thanks very much! Steve Hubbell KC6YHN

Hi!

Could anyone send me some information on the German WAMPES packet
system/protocol ? What does it support, what hardware does it run on,
does it have any unusual/interseting features etc ?

Ein Antwort in Deutsch geht auch prima!

73.

I known a few projects, but sofar I known there are only prototypes.
But there is one board that is based on a 68302. It has 3 highspeed
channels and 2 medium speed channels. It is build on a multilayer board
and isn't cheap ($~800.=) The company has changed there name. I remember
me only the old name Greace.

 >Does this describe a DRSI card? I know nothing about them...
The DRSI hasn't a microprocessor on the board. On the DSRI board is
a single Z8530, a Z8536 (2 timers as 32 dividers for 8530 full duplex
mode and 1 timer as interrupt timer) and a 1200 baud modem.

You can find a lot of packet radio publications in the proceedings
of the Computer Networking Conferences of the ARRL. You can order
them from the ARRL (See QST). You can find my OptoPcScc in the
proceedings of the 8th CNC. This is a four channel IBMPC board without
processor. It is based on 2 * Z8530.

It is nice to have a board with his own processor, but for low or medium
speed you can use the processor of the PC.

I have this information only in German. I can read it, but not a good
translator. If you want the German version posted or do the translation
send me an email. (The size is about 30K text.)
